FINANCING OF PUBLIC ENTERPRISES IN POLAND

II. FINANCIAL POLICY

The overwhelming part of Poland's industrial production comes from public enterprises. The share of public enterprises in Polish industrial production reached 90% in 1967, when the share of manufacturing cooperatives totalled 10%. Only about 1% of industrial output was manufactured by small private enterprises and artisans or workshops.

State-owned enterprises in Poland, like in economic systems of other socialist countries, represent units in organizational and economic sense. They independently dispose of a fixed and working capital assigned to them, independently undertake and regulate their obligations.

General principles of the financial organization of state enterprises are regulated by the government. These regulations are gradually improved, by experience, which is gathered in course of time and the experience in the character and structure of the economy. According to its requirements, and generally at the formulation of the Five-year Plan, so that in the course of fulfillment of the plan the principles of financial organization of state enterprises are relatively stable. Polish economy enters the new five-year plan in 1971. This gives an opportunity to discuss new valid experience, draw conclusions and prepare new proposals concerning, particularly, the nature of the principles governing finances of state enterprises. The discussion is just underway. The subject of the present paper, however, refers to this paper - it is necessary to relate to correct rules of actual principles of financing of state industrial enterprises in Poland, but to some extent will also concern the role of bank lending to industrial enterprises. The particular features of financing of state industrial enterprises, particularly in operation, were introduced in 1964. According to the newly formed state industrial enterprises are equipped with a central statutory fund, which covers all expenses of the enterprise, including inventories, plant, buildings, furniture and fixtures directly from the state budget. The expenses of the enterprise are either by accumulating a fund of the state budget or by the new budget. Since the formation of the new budget, the budget allocation of investment may be reduced. Large-scale investments resulting in significant increase of production are considered therefore as follows:

State industrial enterprises are grouped in Poland branch-wise forming the so-called "corporations (trusts) of industrial enterprises". The head office of the "corporation" supervises its subsidiaries or enterprises within the corporation, acts as a "decision maker" in some specific economic fields (allocation of production of industry into goods in separate enterprises, medium-term investments in fixed assets, technical program policy, export policy), and arranges funds for the promotion of growth of the whole branch of industry. The head office determines as well the main planning targets (total production, protection of some, most important goods, exports, profitability, efficiency) and puts certain quantitative norms used to reach these targets such as global fund of wages, quantity of employment, import of raw materials - according to planned targets and ceilings fixed for the entire "corporation" by the relevant ministries including such industry ministry of Ministry for Army, Industry, Ministry for Machine Industry, Ministry for Food Industry.

1. Division of profits and formation of funds.

State industrial enterprises sell their products at "industrial selling price", fixed by state authorities called Special Committees for Prices generally at the level of equilibrium between supply and demand. The gross profit can be a difference between the industrial selling price and the prime costs of production, however, a different situation exists in branches of industry, generally it is higher in consumer goods than in investment goods. There are established special "factory prices" to diminish these differences. The factory price of a commodity contains its planned average prime costs and a rate of the net profit. This rate of the net profit is to calculate separate factory prices as is the case for each commodity. The rate can be used as an instrument of the state economic policy, for example if the governmental economic authorities want to promote the output of given goods, they can calculate higher rate of net profit when fixing the factory price. The difference between the industrial selling price and factory price to be paid to the budget in turnover tax. The difference between the factory price and prime costs of production forms the net profit.

The principles of forming the prices are now criticized and proposals to take some changes in this field put forward. The reason for this criticism is the fact, that the proportions between the factory prices of various goods are quite different from the proportions between the industrial selling prices of these goods. Consequently the producer interested in net profit, is not informed of the preferences of the buyer which are reflected in the level of industrial selling prices and the buyer is not informed of the costs of production which are reflected in the level of factory prices.

As a result of these criticisms proposals are now put forward to abandon the establishment of factory prices and, to collect the turnover tax as a percentage to the global turnover of an enterprise, rate of the turnover tax being established at the same level for branches of industry or for great groups of goods. This system of turnover tax can be introduced only very gradually carefully because its effect will depend on prices which are very strictly related to retail and selling prices and which must themselves change if, and only if, the system of unified rates of turnover tax is introduced.

The net profit of a state industrial enterprise is divided into four parts:

- interest on fixed assets paid to the state budget
- enterprise fund which is the share of the employees in the profit
- transfer to the head office of the "corporation" and
- development fund of the enterprise.

Interest on fixed assets: This is a kind of property tax. It was introduced in 1936 to encourage state industrial enterprises to use more effectively their fixed assets and to calculate more carefully the investment projects. The rate of interest is fixed generally at 5% of the net value of the amortization basket of fixed assets. In some branches of industry, profitability of which is rather low, the rate of interest is lower as well as totals 2.5%.

Enterprise fund: The planned amount of enterprise fund is fixed in the annual plan of each enterprise as a percentage of the planned yearly payroll. This percentage varies in different branches of industry from 3.5% to 5.5%. If an enterprise will reach the profitability coefficient, i.e., the relation between the net profit after paying the interests on fixed assets and the prime costs of production, according to the plan, then such an enterprise forms enterprise fund in the planned amount. If the actual profitability coefficient is higher than it was planned, then the enterprise forms the enterprise fund correspondingly higher than it was fixed in the plan. In the opposite case, that is if the actual profitability coefficient is lower than it was planned, the enterprise fund is no less lower than it was fixed in the plan; and if the actual profitability coefficient falls below 80% of the planned coefficient, the enterprise forms no enterprise funds at all.

The enterprise fund is a source of rewards paid to the employees of an enterprise and for financing social investments such as construction of dwelling houses. In 1967 the expenditure of the enterprise funds in industry totalled 5,34 million zlotys, i.e. 11% of the net profit of state industrial enterprises after paying the interest on fixed assets and 1% of the yearly payroll in these enterprises.²⁾

After formation of the enterprise fund the rest of the net profit is divided, accordingly to the normative fixed for each enterprise by the head office of the relevant corporation, into transfer to the head office and development fund.

The development fund:- This consists of financial part of the increase of working assets in the form of inventories and small-scale investments or the so-called centralized investments. First of all the enterprises have to form from the development fund 60% of increase of so-called "current" inventories and 40% of increase of irregular inventories. The inventories of an industrial enterprise are classified as follows:

- regular inventories divided into current and seasonal inventories; and
- irregular inventories

Current inventories are those which are necessary to carry on the normal economic activity of an enterprise.

Seasonal inventories are connected with the seasonal character of purchases or output sales in a food industry, or with seasonal character of production results of financial works.

Irregular inventories are those which are completed less for a given enterprise than it needs for purchase of raw materials for production of goods, which are not produced by the enterprise, or inventories gathered in excess of needs.

A state industrial enterprise is required to finance 60% of current inventories and 40% of irregular inventories with its own capital. If these inventories are not covered, the enterprise has to incur as additional costs own working capital from the development fund. The rest of the development fund is used to finance decentralized industrial enterprises.

²⁾ *Konstrukcja statystyczna*, 1967, pp. 142, 376 and 574

In 1967 the total development funds of state industrial enterprise amounted to 14,009 million zlotys, i.e. 1% of the net profit of these enterprises after payment of interest on fixed assets. From this sum 10,007 million zlotys were provided to increase own working capital of these enterprises and 5,001 million zlotys were spent to finance investment outlays. The rest covered other outlays, such as repayment of loans granted previously by the head office of the corporation from its reserve fund.

The reason to regulate in such a way the direction of using the development fund was an intention to encourage the effective use of working assets, i.e. inventories. All or almost all Polish state industrial enterprises used investments in fixed assets and there is a very great interest in all modernisation schemes. The regulations concerning the use of the development fund should enable every enterprise to increase its investments in fixed assets, if the increase of inventories could be lowered. In the opposite case, i.e. if the increase of inventories is relatively high, the part of development fund remaining for financing of investment outlays is very small. Thus the enterprise has a choice between increasing its inventories or increasing investments in fixed assets.

The experience in this field is, however, rather poor and new proposals to change the way of financing the increase in working assets and decentralized investments in fixed assets are being considered.

First of all the demand for investment goods in Poland is generally very high. This is connected with the big investment projects financed at centralized enterprises and this can no longer be undertaken without serious effect on the investment market. In the first place, many industrial enterprises have disposed of rather large sums from their development funds provided to finance the increase in inventories; and the only way to control the use of surplus funds at these enterprises is to enter into a special kind of deposit accounts with the banks. These deposits, relatively short-term, are paid interest at the rate of 5.4%, when the term is one year and 6.3% when the term is longer than one year.

In view of the fact whether it is sensible to give up the centralized investments, especially if the increase of inventories was so high that it absorbs the whole development fund. The greatest part of the decentralized investments consists of purchases of machines necessarily to replace the machines which cannot work any longer. An enterprise will have to present guarantees of the normal course of production and the bank will then grant a loan to the firm. For this purpose it is not necessary for the latter to pay any resulting from the last insurance or protection proceeds.

Therefore, in most cases the amount of the increase of inventories did not affect the amount of investment outlays of separate industrial enterprises - lower increase of inventories did not cause higher decentralized investments in fixed assets, and higher increase of inventories did not diminish the decentralized investment outlays, which were considered as necessary to maintain the normal conditions of production.

In discussions now under way in the country some economists have proposed the elimination of the development fund as a joint source for financing the increases of inventories and decentralized investments and to form out of the net profits two separate funds one for increases in working capital and the other to finance decentralized investments.

2. Financing of fixed assets.

There are three kinds of investments in fixed assets in state-owned industry:

- centralized investments
- corporation investments
- enterprise investments

Centralized investments are decided individually by the government. They contain investments most important for the growth of the national economy, for example the construction of new large plants. Centralized investments are financed by bank credit during the course of their realization, that is, from the commencement to the commissioning of a given investment. Granting credit for the course of realization of an investment was designed to increase the bank's control over costs and terms in which the investments are made. Credit for centralized investment is repaid after the commissioning of a given investment from the budgetary subsidies and, partially, from the centralized part of the depreciation fund, the part of this fund over and above the outlays for major repairs and for corporation investments.

Credit for centralized investments is interest-free if the actual cost of the investment is not higher than it was planned in the investment project and the period of its accomplishment is not longer, than the normal time for such kind of investments; or not longer than it was originally planned in case where there is no established normal period. If the planned cost of a given investment or planned period of accomplishment is exceeded, the bank charges credit for centralized investments with a penalty interest up to 3%.

Corporation investments are decided by the head office of a corporation or trust. They include investments resulting in the major increase of output as well as minor modernization schemes. They are financed from the investment fund of the corporation. This investment fund of the corporation is formed from two main sources: transfers from profits of enterprises and depreciation funds of these enterprises.

A corporation can also obtain bank credit for financing of corporation investments; such credit is repaid from the investment fund of the corporation. The maximum term of repayment is 10 years with interest rate of 3%. The interest rate can be increased by the bank if the planned cost of given investment is overstepped. Normal interest is considered as an element of investment outlays thus increasing the cost of a given investment. Penalty interest is considered as a loss and is entered on the debit side of the profit and loss account.

Enterprise investments or decentralized investments are financed from the development fund of an enterprise after covering the established part of the increase in working capital. All decisions concerning this kind of investment are made independently by the enterprise. The enterprise investments are mainly the purchases of replacement machinery, investments resulting in a relatively small increase of production and minor modernization schemes. The enterprises can obtain bank credit to finance these investments. Credit thus obtained carries an interest rate of 3% repayable within five years from the development fund of the enterprise.

Figures on the amounts of investment outlays in industry with their division into various kind of investments are not available. To give a general opinion on the relations between the magnitudes of several kinds of investment, we can use however the figures concerning the investment outlays of all the branches of state owned enterprises and their managing institutions. These figures for the year 1967 are as follows:

4

3/Profit transferred by the enterprise to the head office of the corporation is divided, accordingly to the normatives of its division set for the corporation by a responsible ministry, into:

- investment fund
- reserve fund providing sources to cover eventual losses or unplanned outlays

- transfer to the state budget.

Depreciation fund of an industrial enterprise is divided into two parts: for major repairs fund for this enterprise and the other is transferred to the investment fund of the corporation. The eventual excess of depreciation fund can be used as a source of repayment of the loans for centralized investments.

	<u>Investment outlays</u>	
	Million zlotys	Percentages
Total	91,310	100,0
Centralized investments	47,373	51,9
Corporation investments	27,344	29,9
Enterprise investments	16,593	18,2

Various methods of planning are applied to different kinds of investments. Centralized investments are planned in details in national economic plans. Corporation investments are planned in national economic plans only in the main terms under the different ministries. Enterprise investments are planned only in general terms without any further division. According to the established regulations corporation investment outlays and enterprise investment outlays can exceed the figures fixed in the national economic plan but not more than by 5-10%, if the material sources of investment financing are accordingly high. This can be conducted with a credit policy that can limit the bank's requirements from the plan, i.e. if the banks should grant corresponding less investment credit, if the corporation and enterprises dispose higher investment funds, then it was anticipated in the plan.

In practice the possibilities of exceeding the figures fixed in the plan had to be more limited, when it was anticipated in regulations referred to above, because of the difficulties on the investment goods market which were already discussed.

The main investment projects and the branch structure of the great part of other investments are decided in the national economic plans to cover centralized investments and corporation investment. In this way the government is able to control very strictly the directions of investments.

In the course of decision-making certain special preferences are taken into account. These preferences concern first of all:

- investment for increasing production of goods for export;
- investments in those branches of industry, which are considered as most important for the technical progress (electronics, automation, chemical industry); and
- investments aiming at making use of the country's raw-material resources (copper mining, sulphur mining, coal mining).

The share of industry in total investment outlays is about 40%. It would be very interesting to compare the investment outlays and the gross value of fixed assets in several branches of industry.

Based on 1 July 1960 figures the following table can be drawn up as follows:

	Investment outlays mill. zl.	Gross value of fixed assets mill. zl.	Share %
Total socialized industry	60,740	120,130	50,6
Fuel industry	11,273	15,160	74,4
Chemical industry	9,098	12,490	71,3
Electrotechnical industry	1,575	11,492	9,0

Before they can be accepted for implementation all investment projects are sorted in either the Centralized Committee (centralized investments) or by the Central Planning Board (enterprise investments). This sorting is done according to the planned effectiveness of the project of investment. The planned effectiveness is calculated according to the formula:

$$E = \frac{\left(\frac{1}{T} + \frac{1}{J} \right) - 1}{1}$$

where:

E - coefficient of the effectiveness

T - maximum period of return of the investment outlays; it is generally accepted for 6 years.

J - investment outlays

- 1. to grant the right of investment to state-owned enterprises, which are not included in the list of state-owned enterprises;
- 2. to grant the right of investment to state-owned enterprises, which are included in the list of state-owned enterprises;
- 3. to grant the right of investment to state-owned enterprises, which are not included in the list of state-owned enterprises, but which are controlled by state-owned enterprises, which are included in the list of state-owned enterprises.

As a result of the above, the right of investment is given to state-owned enterprises or their affiliated organizations, which are not included in the list of state-owned enterprises, but which are controlled by state-owned enterprises, which are included in the list of state-owned enterprises.

This will be done in the following manner:

- to grant the right of investment to state-owned enterprises, which are not included in the list of state-owned enterprises, but which are controlled by state-owned enterprises, which are included in the list of state-owned enterprises;
- to improve the organization of implementation of investment projects, first of all by investing in construction work and to reduce costs of investments.

Therefore, it will be necessary to take a self-financing, i.e. financing of investments from internal funds of enterprises and corporations, making it difficult for them at the time mentioned above.

Therefore, there are proposals to grant credit for all investments except for the simplest ones.

All investments in state industry are to be divided into two kinds:

- branch investments
- enterprise investments.

the first time in the history of the world.

4. Mobilization of household savings

There is no direct connection between mobilization of household savings and financing of industry in Poland. Two general institutions in Poland mobilize household savings: General Savings Bank, a State bank, operating mainly in towns and independent towns and savings cooperatives. The mobilized savings enter first into the capital of the General Savings Bank, which accumulates savings on account with National Bank of Poland, which is shown as one of the sources of its credit to the different sectors of the economy. National Bank of Poland is the bank of issue, but also grants credit directly to socialized enterprises. Loans and savings cooperatives are part of the accumulated savings as a source for their credit activity, and deposit part on accounts with National Bank of Poland.

There are various kinds of savings deposits in Poland. Normal savings books yield no sight, p. interest rate of 3.5 per cent. Term deposits pay interest from 4 to 7.5% annually. There are also special savings deposits, which pay their depositors an interest rate of all out partake in lotteries. Most popular among the special savings deposits are those deposits which partake in lotteries for prizes such as cars.

Total savings deposits by the end of 1967 were as follows: 8/

General Savings Bank	63.021 million zlotys
Loans and savings cooperatives	13.731 million zlotys
Total	76.752 million zlotys

The structure of savings deposits in General Savings Bank was by the end of 1961 as follows:

Total savings deposits	53.021	100,0
Paid at sight	31.217	49,5
Term deposits	18.999	30,2
"Lottery" deposits	10.404	16,5
Other deposits	1.401	3,3

5. Management of financial resources

In enterprise

According to the law, a manager of a state enterprise is appointed by a responsible minister. A minister can however hand over his power to the manager of the corporation.

In practice, the managers of big state industrial enterprises are appointed by **their** respective ministers, till the others by managers of corporations.

The enterprise management run the enterprise, make decisions, and are responsible for the effective operation of the enterprise. The independence of enterprise management is however limited in two ways:

- because of targets and limits of the plan set for the enterprise by the supervising institutions or the head office of the corporation,
- because of regulations determining the conditions of economic activity.

Within the last few years there has developed a tendency to enlarge the powers of enterprise management as well as those of corporation management. There is a widespread opinion that decision-making in most important issues should be left to the large economic units i.e. corporations or groups.

Practically, enterprise management disposed relatively independently of working capital but they are limited in decision-making in the field of investments in fixed capital. Only a relatively small part of investments is determined to the management of individual enterprises.

26. I. 72
