Interregional Petrochemical Symposium on the  
Development of the Petrochemical Industries  
in Developing Countries

Kiev, USSR, 20 - 31 October 1969

PET. SYM. D/4

### SUMMARY

#### COMPETITION BETWEEN POLYESTERS AND NYLONS AND THEIR FUTURE PROSPECTS 1/

presented  
by

E. Yamamoto

Technical Committee of Japan Chemical Fibres Association

The production of nylon and polyester in Japan in 1968 was about 210,000 tons and 180,000 tons, respectively. Both fibers showed about 20 percent increase annually. Nylon filament, with a remarkable increase, accounted for about 94% of overall nylon production. With polyester, staple fiber in production, in recent years filament has been increasing production and accounts for about 34% of total polyester production.

The production of new materials for nylon and polyester are based on the petrochemical industry. Their production cost could be expected to be reduced by collaboration with the petrochemical industry. Meanwhile the Japanese producers have been exerting efforts to improve production processes and to utilize new procedures. These factors will

1/ The views and opinions expressed in this paper are those of the author and do not necessarily reflect the views of the Secretariat of UNIDO. This document has been reproduced without formal editing.

and to possible cost reduction in the production of both fibers. At present, both fibers are produced by melt spinning, but new processes are being developed such as continuous polymerization, direct spinning or high-speed continuous spinning without drawing process.

Nylon has many good properties: excellent dyeability, strength, superiority in elastic and very small young's modulus. Polyester has other valuable properties; better blending with other fibers, perfect moisture resistance, excellent wrinkle resistance, high resistance to heat in particular conditions necessary for dyeing.

Nylon is used for industrial materials with a shore of about 30% because of its excellent strength. Especially, in the sector of the tire-tyre nylon is predominant with a shore of about 9%. Nylon is also used widely for apparel and interior materials, as woven or knitted fabrics, especially soft fabrics made with textured yarn.

Polyester is also used widely for apparel and interior materials. Polyester staple is mainly used for various kinds of apparel by blending with other fibers. In recent years, however, polyester filament is used for underwear because of the unique qualities of its fabrics made with textured yarn. Polyester has, presently, a small share of industrial materials, but with its excellent properties it is expected to be used much more in this field in the future.

Nylon and polyester are the leaders in the synthetics fields. However, these fibers are being used in different fields because of their unique characteristics. While they are competitive in some fields, as a whole they are expected to develop in one course being complementary to each other because of their properties.

## Advantages of Fiber spinning Processes

For the polyester market produced by the meltspinning process. Production is based upon classification of the polymerization processes. In the case of the drawing and drawing plus heat direct spinning process, the fiber is drawn directly from the melt as employed. In the case of the meltspinning process, the spinning is usually spinning at a temperature slightly higher than melt-spinning after drying and drawing. The drawing plus heat process is similar to direct spinning and the heat treatment is added or applied. For high polyester, the drawing plus heat process is being employed in the field of staple. This is due to the fact that certain thermoplastic polymer does not have the ability to be spun.

The drawing plus heat process is having three types of thermal temperature which is the first is melting point to fiber draw, while temperature of the second is the second transition point of approximately 250° F. The third is the glass transition point of fiber draw which is about 350° F. Various properties can be imparted to the fiber by the spinning, drawing and heat treatments conditions.

### Spinning Process

The spinning process of fiber spinning is toward the fiber and the fiber production, fiber spinning is a combination of the drawing and the spinning of the fiber. It is also known as drawing and spinning to produce the fiber yarn.

The spinning of the fiber is a method of spinning the fiber, in this case, an i-silane polymer is used as a spinning agent. In spinning, first, the fiber is heated to a temperature of about 200° F. and simultaneous with the heating, the fiber is drawn. While the fiber is heated, the fiber is drawn to a longer length.

The spinning process is more important, in the method of spinning, the fiber is drawn into one condition step by step under cover of the fiber. The fiber process will reach a commercial product in the fiber spinning. If further advanced, such as an approach to obtain a fiber by drawing fiber and spinning by passing over the drawing and the fiber, it probably help to reduce plant installation area,

REVIEW OF THE LITERATURE ON THE PROBLEMS OF THE POLYMER INDUSTRY WITH  
PARTICULAR REFERENCE TO THE PROBLEMS OF THE POLYMER INDUSTRY IN THE  
Soviet Union. THIS IS THE FIRST PART OF A SERIES OF REVIEWS OF THE POLYMER INDUSTRY

### 1. THE POLYMER INDUSTRY IN THE USSR

The Soviet Union has a large number of polymer plants, which produce a wide variety of polymers.

The following table gives some information about the polymer industry in the Soviet Union.

## THEORETICAL CONSIDERATION

The theoretical consideration of the problem of the effect of the temperature on the rate of the reaction is based on the assumption that the reaction is first order with respect to the reactant.

The reaction is assumed to proceed through a series of steps, each step involving a change in the concentration of the reactant.

The first step in the reaction is the dissociation of the reactant into two molecules.

The second step is the recombination of the two molecules into the original reactant.

The third step is the dissociation of the reactant into two molecules.

The fourth step is the recombination of the two molecules into the original reactant.

The fifth step is the dissociation of the reactant into two molecules.

The sixth step is the recombination of the two molecules into the original reactant.

The seventh step is the dissociation of the reactant into two molecules.

The eighth step is the recombination of the two molecules into the original reactant.

The ninth step is the dissociation of the reactant into two molecules.

The tenth step is the recombination of the two molecules into the original reactant.

The eleventh step is the dissociation of the reactant into two molecules.

The twelfth step is the recombination of the two molecules into the original reactant.

The thirteenth step is the dissociation of the reactant into two molecules.

The fourteenth step is the recombination of the two molecules into the original reactant.

The fifteenth step is the dissociation of the reactant into two molecules.

The sixteenth step is the recombination of the two molecules into the original reactant.

The seventeenth step is the dissociation of the reactant into two molecules.

The eighteenth step is the recombination of the two molecules into the original reactant.

The nineteenth step is the dissociation of the reactant into two molecules.

The twentieth step is the recombination of the two molecules into the original reactant.

The twenty-first step is the dissociation of the reactant into two molecules.

The twenty-second step is the recombination of the two molecules into the original reactant.

The twenty-third step is the dissociation of the reactant into two molecules.

The twenty-fourth step is the recombination of the two molecules into the original reactant.

The twenty-fifth step is the dissociation of the reactant into two molecules.

The twenty-sixth step is the recombination of the two molecules into the original reactant.

The twenty-seventh step is the dissociation of the reactant into two molecules.

The twenty-eighth step is the recombination of the two molecules into the original reactant.

The twenty-ninth step is the dissociation of the reactant into two molecules.

The thirtieth step is the recombination of the two molecules into the original reactant.

The thirty-first step is the dissociation of the reactant into two molecules.

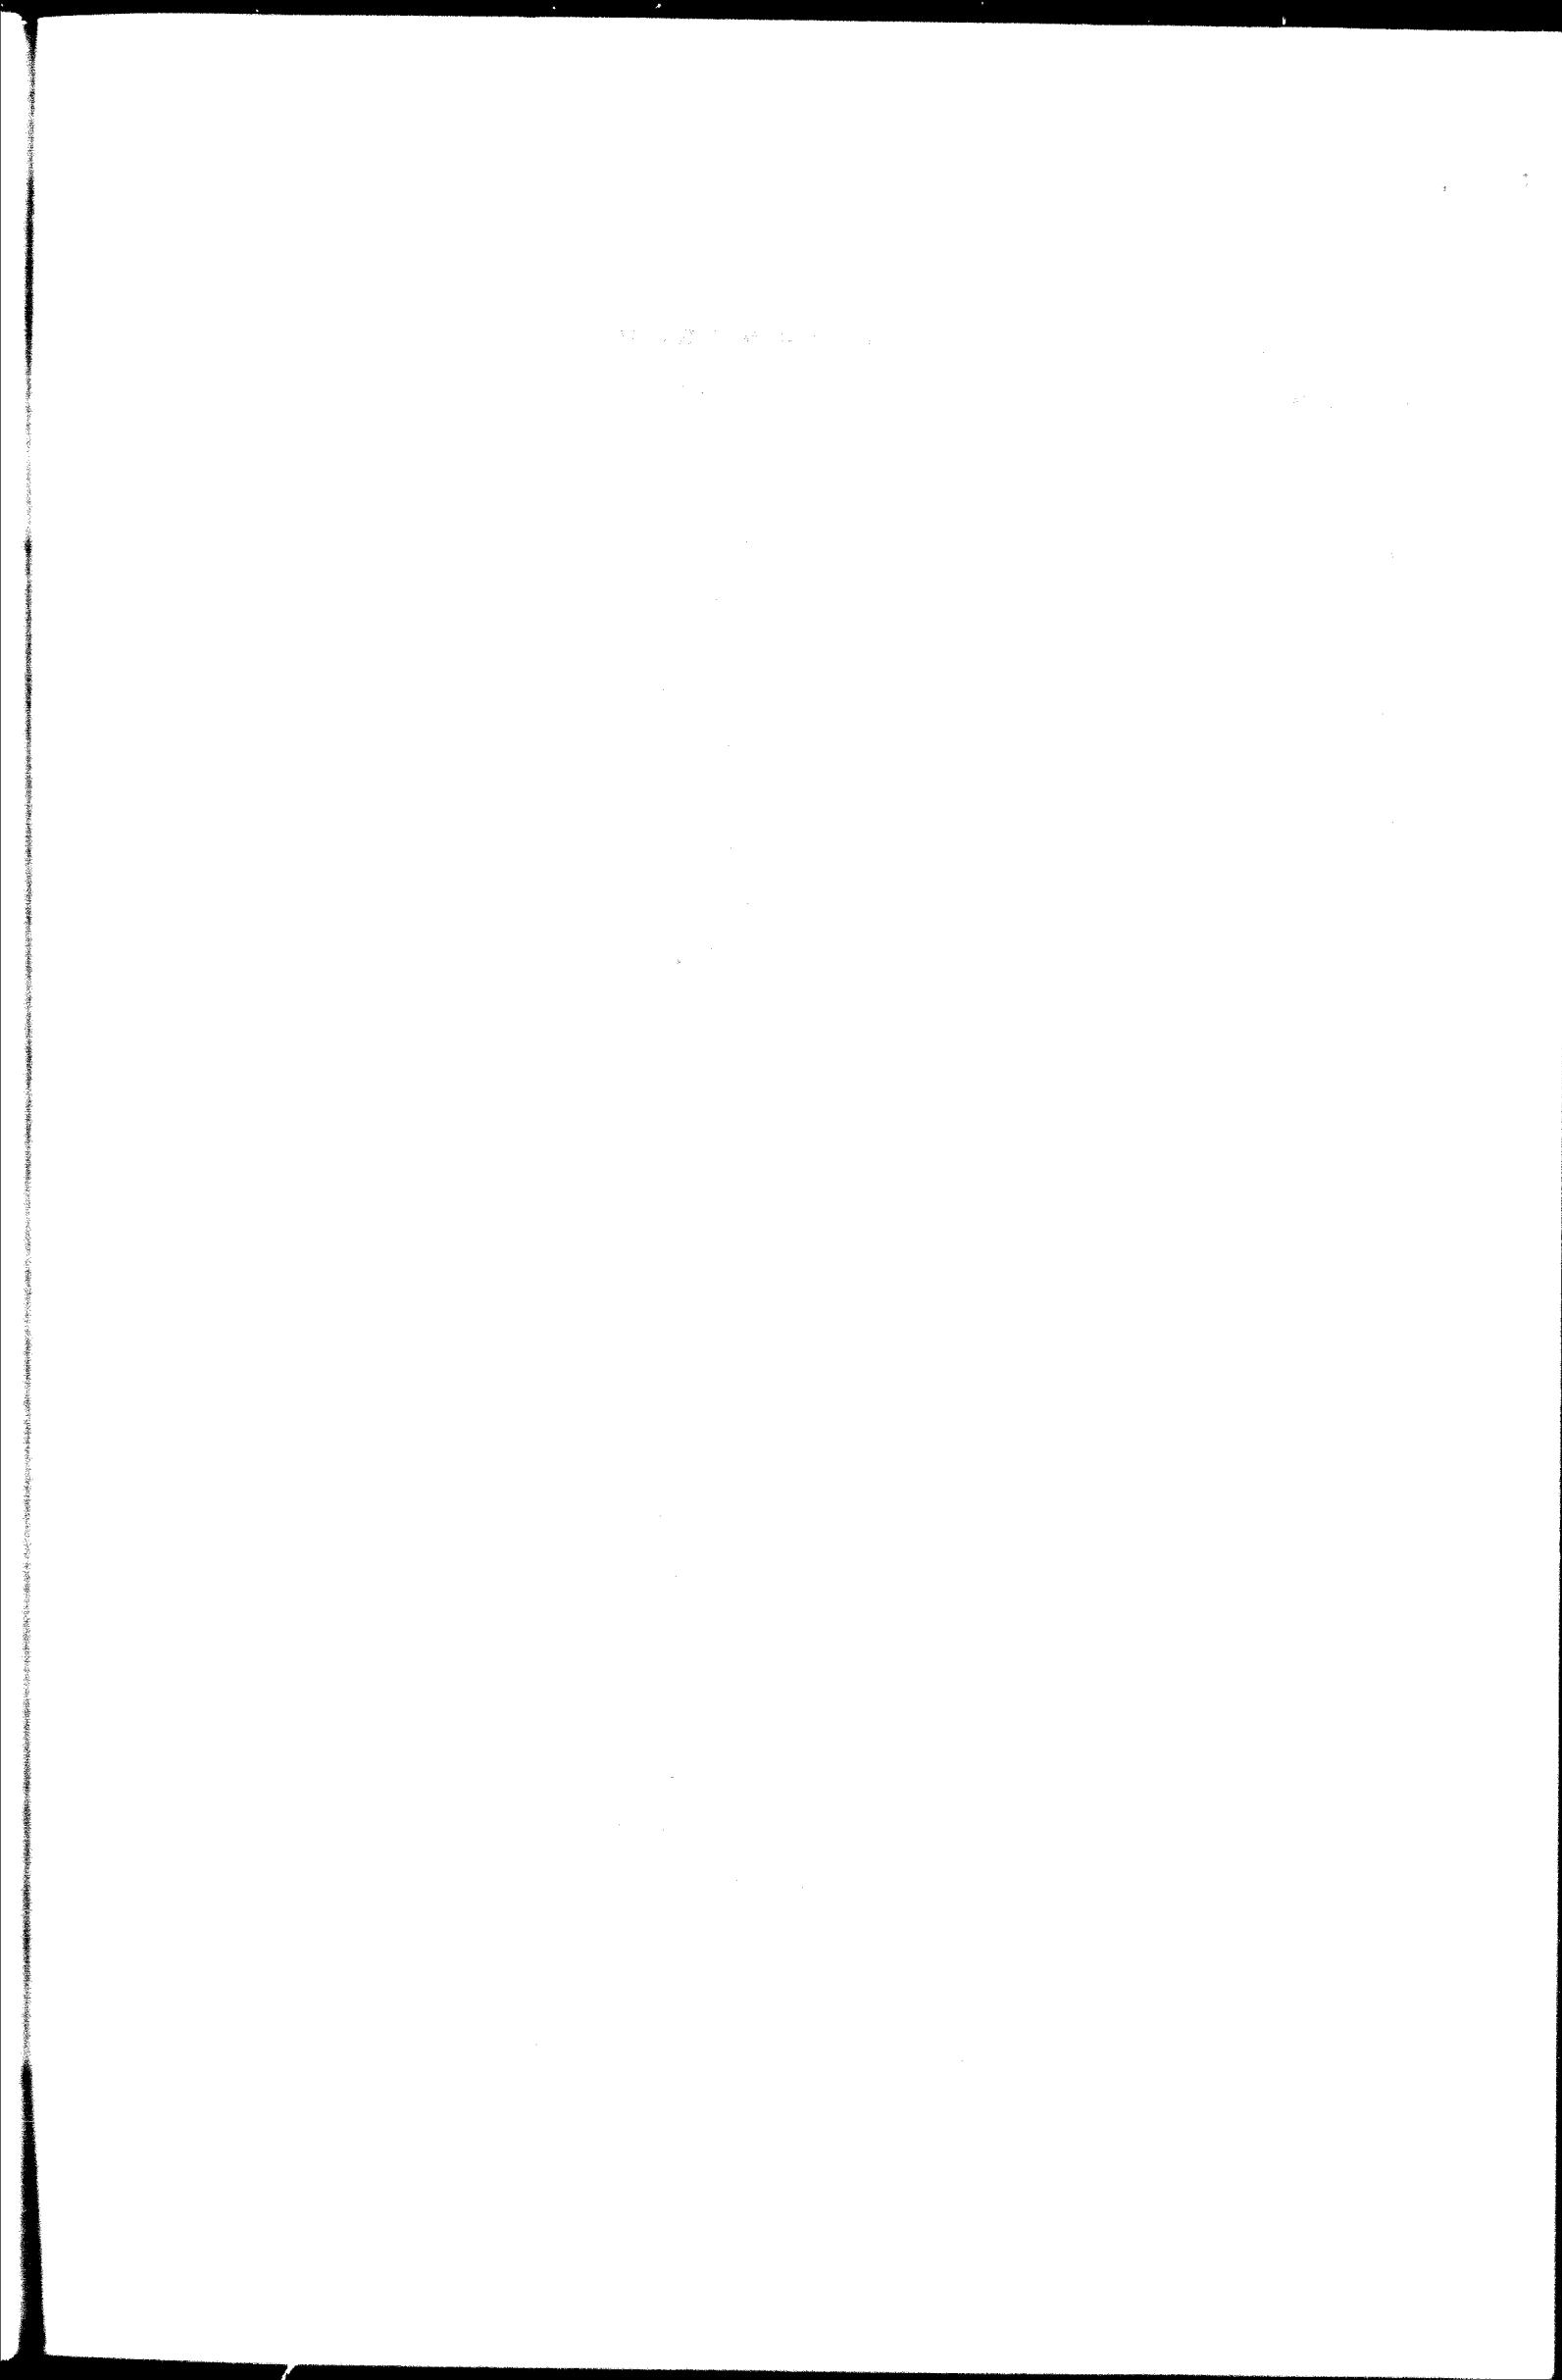

The thirty-second step is the recombination of the two molecules into the original reactant.

The thirty-third step is the dissociation of the reactant into two molecules.

The thirty-fourth step is the recombination of the two molecules into the original reactant.

The thirty-fifth step is the dissociation of the reactant into two molecules.

The thirty-sixth step is the recombination of the two molecules into the original reactant.

Fig. 2. System Kretschmann's.

### NON-WOVEN MATERIALS

Household cloths and blankets are examples of use.

Automobile interiors, upholstery, curtains, carpets, table cloths, and linings, floor cloths, and cushions.

Non-woven materials are popular as well, as woven carpets are being replaced by a great part of their low cost, and the desire for these carpeting materials to be lighter, cleaner, and more durable, the introduction of non-woven materials and antistatic fibers has increased the popularity of these. For the further advance of application these applications will be discussed.

### NON-WOVEN MATERIALS

Non-woven materials in industrial applications are the biggest market for them. The insulation resistance in combination with other properties, such as electrical insulation, magnetic and chemical resistance, make them useful, finding their place in insulation, cables, and insulation, in the production of oil filters, insulation, filters, parachutes,

and many other applications. Non-woven materials are also used in the production of insulation, filters, and insulation.

Non-woven materials are also used in the production of Mylar, which is a thin plastic film used in insulation, filters, and insulation. However, the market for non-woven materials is still small, and the component parts of the total market for non-woven materials are not yet at the total market for non-woven materials.

Non-woven materials are highly correlated to mineral materials, such as asbestos, talc, mica, and graphite, and in combination with these materials it is anticipated that nylon will be the further growth in the market for non-woven materials.

### NON-WOVEN MATERIALS

Nylon fiber is also widely used as raw material for non-woven materials, such as insulation cloth, lining, filters and base material

## 1. THE CLOTHING OF THE PEOPLE.

The clothing of the people of the United States is simple, comfortable, and becoming. It is made of good materials, and is well fitted to the climate and habits of the country. The men wear coats, jackets, trousers, and hats; the women wear dresses, bonnets, and shoes. The colors are generally light, and the materials are soft and pliable.

## 2. THE CLOTHING OF THE INDIANS.

The clothing of the Indians is simple, but comfortable. They wear breeches, shirts, and moccasins. The men also wear hats and caps. The women wear dresses, bonnets, and shoes. The colors are generally dark, and the materials are rough and coarse. They are made of animal skins, and are often decorated with beads and feathers. The Indians are fond of ornamentation, and their clothing is often very showy.

## 3. THE CLOTHING OF THE CHINESE.

The clothing of the Chinese is simple, but comfortable. They wear breeches, shirts, and moccasins. The men also wear hats and caps. The women wear dresses, bonnets, and shoes. The colors are generally dark, and the materials are rough and coarse. They are made of animal skins, and are often decorated with beads and feathers. The Chinese are fond of ornamentation, and their clothing is often very showy.

## 4. THE CLOTHING OF THE AFRICAN SLAVES.

The clothing of the African slaves is simple, but comfortable. They wear breeches, shirts, and moccasins. The men also wear hats and caps. The women wear dresses, bonnets, and shoes. The colors are generally dark, and the materials are rough and coarse. They are made of animal skins, and are often decorated with beads and feathers. The African slaves are fond of ornamentation, and their clothing is often very showy.
