SECRET

REPORT ON THE RESULTS OF THE SYNTHESIS OF  
POST-WAR ECONOMIC POLICY REFORMS

1

United Nations  
Industrial Development Organization  
New York

1. At present, Cuba is one of the few countries in the world which has a high rate of growth, and a high rate of industrialization, and a high rate of economic development.

The production of goods and services is increasing rapidly, and the living standards of the population are rising.

2. In order to continue to maintain a high rate of growth, it is necessary to continue to improve the economic structure, and to continue to improve the living standards of the population.

3. The main objective of the economic reforms is to improve the living standards of the population, and to continue to improve the economic structure.

4. The economic reforms are necessary in order to improve the living standards of the population, and to continue to improve the economic structure.

2/ The figures in this paper are based on the data of the author and do not necessarily reflect the views of the United Nations. This document is not a report, but a study.

We regret that some of the pages in the microfiche copy of this report may not be up to the proper legibility standards, even though the best possible copy was used for preparing the master fiche.

The production of polymeric ester copolymers of vinyl monomers with aromatic dicarboxylic acid chlorides (dichlorobenzene, dichlorophenylene, etc.).

The degree of conversion of the monomers is high and low.

6. It is shown that the copolymers prepared are of a higher molecular weight than the corresponding homopolymers.

7. The copolymers prepared are of a higher molecular weight than the corresponding homopolymers. The copolymers prepared are of a higher molecular weight than the corresponding homopolymers.

8. The copolymers prepared are of a higher molecular weight than the corresponding homopolymers. The copolymers prepared are of a higher molecular weight than the corresponding homopolymers.

9. The copolymers prepared are of a higher molecular weight than the corresponding homopolymers. The copolymers prepared are of a higher molecular weight than the corresponding homopolymers.

The above list of fields of application does not pretend to be complete and is only an illustration of the wide field of possibilities of ion exchange.

It includes only such fields of ion exchange which have gone from laboratory investigations to industrial application. It is difficult to mention any branch of science and technology where ion exchange is not used in this or that degree. The scale of production of ion exchangers is mainly determined by the requirements of water treatment comprising 75% of the total consumption of ion exchangers. Being the oldest field of ion exchange application, water treatment, at present, has reached technical perfection. Being developed first for the power stations it has now penetrated all the fields of human activities. At present, for example,

water softening is used for the water purification of power plants, for the textile, medical and chemical industries, food and engineering, etc. [1].

Ion exchange water softening, developed in the recent years, enables to purify water from such cations as fluorine, which are hazardous. In recent, it has been must show the water softening, that drinking water should contain from 1 to 2 mg/l of fluoride substances.

Higher content of fluorides is dangerous. However in some countries: Algeria, Tunisia, Spain, Italy, South America, USSR and some regions of the USSR fluoride content is considerable exceeds the figure. Ion exchange water softening is an efficient means of the removal of surplus amount of fluorides. With this aim in view strongly basic cation exchangers in chloride forms are used. The role of ion exchange is very large and, undoubtedly, very soon it will find its proper place in the utilization of ion exchange. Deionization and desineralization of water through ion exchangers were developed much later as compared to water softening and in the recent years have become the most methods of water treatment. It presents considerable importance of the content of organic substances in natural water is increased both in serious quantities in the utilization of ion exchange. The amount of organic impurities is different for various sources and is variable throughout the year; this presents difficulties in developing efficient methods of their removal. Such universally accepted methods of removal of water hardness: deionation, desineralization, filtration, etc. and also, while being relatively necessary in the water treatment, however, cannot always provide the required degree of purification. In the process of water purification, organic substances will pass the surface of ion exchange resin and will be removed completely through ordinary regeneration. The main types of organic impurities are of polar nature, consisting of ester, ether, alcohol, however, their high molecular weight makes their removal difficult. Cationic compounds of ion exchange resin are soluble, particularly allowing up on the hydrophilic character of resin, leading to the reduction of the efficiency of the purification, and growth of resistant compounds. For the regeneration of water softening resins ion exchangers are used to remove impurities of all. Ion exchange exchangers being efficient with relatively pure water from the point of view of

studied for ion exchange and nitration - hydrolysis reactions. Ion exchange resins have become very important for the purification and concentration of antibiotics (streptomycin, tetracycline, penicillin and other antibiotics). In the USSR, ion exchangers NI-1 - 2, NI-2, NI-3, NI-4, NI-5, NI-6, NI-7, NI-8, NI-9, NI-10, NI-11, NI-12, NI-13, NI-14, NI-15, NI-16, NI-17, NI-18, NI-19, NI-20, NI-21, NI-22, NI-23, NI-24, NI-25, NI-26, NI-27, NI-28, NI-29, NI-30, NI-31, NI-32, NI-33, NI-34, NI-35, NI-36, NI-37, NI-38, NI-39, NI-40, NI-41, NI-42, NI-43, NI-44, NI-45, NI-46, NI-47, NI-48, NI-49, NI-50, NI-51, NI-52, NI-53, NI-54, NI-55, NI-56, NI-57, NI-58, NI-59, NI-60, NI-61, NI-62, NI-63, NI-64, NI-65, NI-66, NI-67, NI-68, NI-69, NI-70, NI-71, NI-72, NI-73, NI-74, NI-75, NI-76, NI-77, NI-78, NI-79, NI-80, NI-81, NI-82, NI-83, NI-84, NI-85, NI-86, NI-87, NI-88, NI-89, NI-90, NI-91, NI-92, NI-93, NI-94, NI-95, NI-96, NI-97, NI-98, NI-99, NI-100 are used. Of these, NI-2 is used in the purification of antibiotics and NI-1 is used for the purification of antibiotics. Ion exchangers NI-1 - 2 are used for the purification of antibiotics.

Industrial production of ion exchangers is being implemented. Ion exchangers are being used for the purification of water and other liquids. The most important ion exchangers for the purification of water are NI-1, NI-2, NI-3, NI-4, NI-5, NI-6, NI-7, NI-8, NI-9, NI-10, NI-11, NI-12, NI-13, NI-14, NI-15, NI-16, NI-17, NI-18, NI-19, NI-20, NI-21, NI-22, NI-23, NI-24, NI-25, NI-26, NI-27, NI-28, NI-29, NI-30, NI-31, NI-32, NI-33, NI-34, NI-35, NI-36, NI-37, NI-38, NI-39, NI-40, NI-41, NI-42, NI-43, NI-44, NI-45, NI-46, NI-47, NI-48, NI-49, NI-50, NI-51, NI-52, NI-53, NI-54, NI-55, NI-56, NI-57, NI-58, NI-59, NI-60, NI-61, NI-62, NI-63, NI-64, NI-65, NI-66, NI-67, NI-68, NI-69, NI-70, NI-71, NI-72, NI-73, NI-74, NI-75, NI-76, NI-77, NI-78, NI-79, NI-80, NI-81, NI-82, NI-83, NI-84, NI-85, NI-86, NI-87, NI-88, NI-89, NI-90, NI-91, NI-92, NI-93, NI-94, NI-95, NI-96, NI-97, NI-98, NI-99, NI-100.

Ion exchangers NI-1, NI-2 are widely used in the industry for the purification of hydrocarbons and vegetable waste.

Lately, ion exchangers are being widely used in the chemical industry:

cation exchanger NI-2 is used for the purification of the liquid for the production of cellulose; for the adsorption of soluble metal; for the manufacture of isopropyl and diphenyl ether; ion exchangers NI-2, NI-3, NI-4, NI-5, NI-6, NI-7, NI-8, NI-9, NI-10, NI-11, NI-12, NI-13, NI-14, NI-15, NI-16, NI-17, NI-18, NI-19, NI-20, NI-21, NI-22, NI-23, NI-24, NI-25, NI-26, NI-27, NI-28, NI-29, NI-30, NI-31, NI-32, NI-33, NI-34, NI-35, NI-36, NI-37, NI-38, NI-39, NI-40, NI-41, NI-42, NI-43, NI-44, NI-45, NI-46, NI-47, NI-48, NI-49, NI-50, NI-51, NI-52, NI-53, NI-54, NI-55, NI-56, NI-57, NI-58, NI-59, NI-60, NI-61, NI-62, NI-63, NI-64, NI-65, NI-66, NI-67, NI-68, NI-69, NI-70, NI-71, NI-72, NI-73, NI-74, NI-75, NI-76, NI-77, NI-78, NI-79, NI-80, NI-81, NI-82, NI-83, NI-84, NI-85, NI-86, NI-87, NI-88, NI-89, NI-90, NI-91, NI-92, NI-93, NI-94, NI-95, NI-96, NI-97, NI-98, NI-99, NI-100 are used for the purification of formaldehyde, NI-2 and NI-11-12 for the purification of caprolactam; NI-2 - for conversion of acetone to ethanol; NI-2, NI-3, NI-4, NI-5, NI-6, NI-7, NI-8, NI-9, NI-10, NI-11, NI-12, NI-13, NI-14, NI-15, NI-16, NI-17, NI-18, NI-19, NI-20, NI-21, NI-22, NI-23, NI-24, NI-25, NI-26, NI-27, NI-28, NI-29, NI-30, NI-31, NI-32, NI-33, NI-34, NI-35, NI-36, NI-37, NI-38, NI-39, NI-40, NI-41, NI-42, NI-43, NI-44, NI-45, NI-46, NI-47, NI-48, NI-49, NI-50, NI-51, NI-52, NI-53, NI-54, NI-55, NI-56, NI-57, NI-58, NI-59, NI-60, NI-61, NI-62, NI-63, NI-64, NI-65, NI-66, NI-67, NI-68, NI-69, NI-70, NI-71, NI-72, NI-73, NI-74, NI-75, NI-76, NI-77, NI-78, NI-79, NI-80, NI-81, NI-82, NI-83, NI-84, NI-85, NI-86, NI-87, NI-88, NI-89, NI-90, NI-91, NI-92, NI-93, NI-94, NI-95, NI-96, NI-97, NI-98, NI-99, NI-100 for the purification of liquid ammonia.

Ion exchange fibers and fibers of well known ion-exchangers are becoming very important; progress technology of their manufacture and fields of their application are being studied at present.

Of great importance now are ion exchange resins for the purification of radioactive waters, for the extraction, purification and separation of radioactive substances, causing extensive and diversified research in the industry of ionizing radiations upon ion exchange materials. In the USSR, ion exchange resins in an typical chemical industry diversified research has been conducted to demonstrate the diversity of ion exchange materials. Fields of their application do not exhaust all of them. For example, utilization of ion exchange resins in various fields of application (1957 - 1958) are listed below.

1/10.3/3  
8.17

Field or region	Consumption of ion exchangers per 1000 m <sup>3</sup> of water
Chernobyl	5,7
Chernobyl-2	3,5
Chernobyl-3	12,
Chernobyl-4	3,5
Chernobyl-5	11,6
Chernobyl-6	11,4

#### Electrodeionization

In the region of the Chernobyl power plant of fresh water consumption in this economic region. On the other hand there are large reserves of salted water in these regions. Therefore extensive work is going on in the number of years with the view to develop efficient methods of saltwater desalination. One of the most promising method is an electrodeionization process. The principle of this method is based on the properties of ion exchangers, their water content and also upon the degree of purification of the water by electrodeionization.

At present numerous diluters with the dilution capacities ranging from 10 to 200 m<sup>3</sup> of water have been developed in the Soviet Union. When being under test these units have shown the following confirming high economic efficiency of the electrodeionization. Electric power consumption for electrodeionization for the desalination of 1 m<sup>3</sup> of demineralized water from the water of underground spring (containing 1 g/l of dissolved salts)

approx. 1.3 kw/hour and respectively 3.5 - 5.5 kw/hour in case of 13.1 g/l salt content. Guaranteed life of an electrodeionizer is 3 years.

Table 2

Main properties of heterogeneous membranes

Descriptor	HK-40	HK-41	HK-42
Electric charge, meq/cm <sup>2</sup>	2.3-2.7	2.4-2.7	2.4-2.7
Selectivity in 0.1% 0.2 M solution of sodium chloride salts	0.95-0.98	0.93-0.95	0.9-0.95
Specific volumetric resistivity, ohm/cm	180-200	200-250	150-180
Specific surface resistivity, ohm/cm <sup>2</sup>	9.8-12	10-15	9-12
Swelling power, %, at thickness	115-130	120-130	130-150
Thickness, mm	0.5	0.5	0.5
Dimensions, cm	1.5 x 1.5	1.5 x 1.5	1.5 x 1.5

The quality of demineralized water is high. It fully meets the requirements of USSR standards for drinking water, does not contain harmful additives and is suited for good taste.

Achievement of such a high quality possible through wide investigations resulting in industrial manufacture of heterogeneous reinforced membranes HK-40, HK-41, HK-42. Main properties of these membranes are given in Table 2.

At present extensive work is expanding the range of products, improving their properties and reduction of electrical energy consumption.

This will enable to use membranes widely in public and industrial enterprises and utilize them effectively for the desalination of salt solutions, purification of liquid effluents and recovery of products of new chemical processes given in Table 3 and 4.

Table 3

Frequency characteristics of a vacuum tube circuit  
and  $\alpha = 0.5$  operating with the following  
 (values of  $\alpha$  are in  $10^{-3}$  ohms)

Description	Frequency			
	1	2	3	4
Value of critical frequency	1.5-2.0	1.2-2.1	1-1.5	0.9-1.3
Value of delay, $\mu$ sec	1-2.5	1-1.5	1.0-12.5	12.5-17.0
Specific admittance	1.2	1.1	1.1	1.1
$\alpha = 0.5$	2.0	2.0	2.0	2.0

1.  $\alpha = 0.5$  (in  $10^{-3}$  ohms) =  $\alpha$ ;  
 $\alpha = 0.5$  (in  $10^{-3}$  ohms) =  $\alpha$
2. Calculation of  $\alpha = 0.5$  (in  $10^{-3}$  ohms) =  $\alpha$  (in  $10^{-3}$  ohms). The value of  $\alpha$  is calculated in terms of  $\alpha = 0.95$  and  $0.93$  and  $0.95$  for the values of  $\alpha = 0.5$  and  $0.5$  respectively.
3. Specific values are calculated for the number of the given tubes in column.

Table 4  
 Characteristics of the vacuum tube circuit

Description	1-10	10-10	10-10	10
Value of $\alpha$ (in $10^{-3}$ ohms)	2.5-2.8	2.0-2.4	1.0	1.0
Value of $\alpha$ (in $10^{-3}$ ohms)	1.5-1.9	1.5-1.9	1.0	1.0
Value of delay, $\mu$ sec	10-15	15-13	2.0	1.0
Value of electric resistivity	2.1-5	3.5-5	1.35	1.0
Value of power, on $\alpha = 0.5$	115-115	115-115	12	18
Value of $\alpha$ (in $10^{-3}$ ohms)	12-15	12-19	13	18
Value of $\alpha$ (in $10^{-3}$ ohms)	1.2	1.2	1.3	1.0

Electron exchange materials

with many of the existing - recovery polymeric materials (electro-exchangers) and materials being developed utilizing-recovery and ion exchange capacities (electron ion exchangers) have been developed in the U.S. It was made possible through these materials to recover industrially valuable dissolved oxygen from the water. The cost of oxygen for the water is of great importance for the corrosion reduction of metal structures and for the maintenance of the fillers, gas-liquid contactors, oxygen removal, small consumption of reagents for the regeneration of electron exchangers, materials and such a method of oxygen removal from the water through electron exchangers or similar systems also have been developed utilizing chemical reagents (for example, hydroxine, morpholine, etc).

Electron exchangers can be inserted for the oxygen removal from the process water utilized for the solution, latex and polymer solubilization. The removal of oxygen traces from this water provides a deceleration of controlled polymerization and copolymerization processes thus leading to a stable effect upon the quality of the polymers produced.

Along with these important fields of application electron exchangers will find utilization in non-ferrous metal slurry, analytical chemistry and biochemistry.

Materials which have found industrial utilization and can be manufactured industrially are given below.

- EI - 5 - electron ion exchanger obtained through deposition of finely dispersed copper upon sulfonated cokes, has absorption power on oxygen equal to  $16 \text{ kg/m}^3$
- EI - 12 - electron exchanger obtained through deposition of finely dispersed copper upon cation exchanger (M-1 and M-1-1) and has absorption power on oxygen equal to  $8 \text{ kg/m}^3$
- EI - 15 - electron exchanger with capacity on oxygen equal to  $9 \text{ kg/m}^3$
- EI - 5b - electron exchanger with capacity on oxygen equal to  $20 \text{ kg/m}^3$
- E - 5 - electron exchanger, obtained through combination of hydroquinone. Capacity on oxygen -  $4 \text{ kg/m}^3$ . During oxygen removal soluble additives are not separated and the product can be reversibly recovered.

1. It is obtained with some difficulty through the formation of complex compounds of hydrochloric acid ion exchange, described by reaction exchange 24-8.

$$\text{R}^+ \text{Cl}^- + \text{M}^+ \text{X}^- \rightarrow \text{R}^+ \text{X}^- + \text{M}^+ \text{Cl}^-$$

2. Difficult to obtain through the utilization of other compounds / 24-11 - reaction exchange 24-10, 24-12 on the basis of ion exchange exchange 24-9.

3. Regarding up, and down with a large number of ion exchange materials capable of satisfying ever existing requirements of the main branches of national economy has been noted in one article. The range of products includes sulfonated acids, cathodic ion exchange resins, ion exchange membranes, aluminum chloride ion exchange resins.

Conclusion

1. Ion exchange resins will play a role in the technical progress.
2. Synthetic resins (ion exchange resin, membranes, aluminum chloride ion exchange resin) number of branches of science and technology. Development of chemical process technology is absolutely indispensable without them.
3. Manufacture of synthetic resins is not a large scale production. It is found on 10,000 tons (estimated on dry weight) in most developed countries.
4. Large number of synthetic materials are developed raw material (ethylene, divinylbenzene, styrene, chloroacetic acid and so on).
5. Capital investment is considerable. The price of products greatly depends upon the scale of production.
6. Developing countries with a large number of valuable reagents. Development of their synthetic resins is possible only under condition of cooperation with a number of developed countries. The range of synthetic resin developed with the cooperation of classic industry development in these countries. However, taking into account the relatively small scale of cooperation in each of the developing countries. This is not to say, the analysis of these materials from the developed countries probably might be very sufficient.

6. The USSR is prepared to present a complete program of cooperation in the manufacture of polymeric resins (including ion exchange resins) as well as show interest in their utilization for water treatment, sanitary purification, and binding of various types of pollutants and of water from acid mining.

7. Until the manufacture of these resins is possible in the USSR and the developing countries the USSR is prepared to provide technical assistance and units on the basis of trade agreements and similar arrangements.
