*Contract 3906*

## 1.0 ABSTRACT

This report within approximately 100 pages of text, 25 tables and four drawings, outlines with recommendations for action, all engineering costs, and economic data what should be done with the Medias "Salconserv" plant, the incorporation of meat extract facilities, and the usage of soya proteins. It is a three-subject report.

The study concludes that the present plants in Medias are too old, damaged, badly laid out, and poorly situated to rebuild. All efforts should be directed to this new plant. However, leaving the plant in its present condition or spending three quarters of a million dollars are possible, but not recommended options. A feasibility study with two layout drawings, cost studies and profitability is included in the work. The new plant situated on 4.1 hectares, with 8,400 square meters of main plant and 2,600 square meters of ancillary building, costing a total of about \$3,500,000, would pay for itself in two years' time at today's price levels.

Detailed designs and layout drawings for the installation of a small 1,200 pounds per hour pilot extract plant, costing \$55,000, installed are included in this work together with specifications and designs of some equipment. This plant should pay for itself in two years and ultimately generate a profit at \$30,000 a year and reduce the sewage effluent to improve its quality as well as supply another food product to the market.

Seven different recipes are included for the use of soya concentrate or flour in the Appendix and a general method for mixing the soya into the meat. The present method used is satisfactory for soya flour, but is more complicated than necessary for the concentrates and isolates.

In addition to recommending proceeding with these three programs, it is recommended that the Romanian Government proceed with these other programs: a training program for Food Plant Maintenance Supervisors and a study group of two engineers to learn improved methods of refrigeration and cooling techniques in the U.S.A.

Finally, a critique of the general meat industry is included: although outside of the scope of work, it praises the high quality of products, the high level of technical meat personnel, the design of the newer meat plant, but ends with a word of caution about the huge size of some of the plants, the poor quality of details of construction, and the difficulty of maintaining a uniformity of quality from multi-plant operations.

## 9.0 APPENDIX

### 3.0 PURPOSE: General

The purpose of this report is to describe and document the work and suggestions that have been made by Arthur G. McKee Company, in collaboration with the Romanian meat experts, to the Government of the Socialist Republic of Romania in regard to the rehabilitation and short and long term expansion programs of the "Salconserv" factory in Medias. Special attention is given to a design of a meat extract and the use of soya protein with meats.

#### 3.1 Scope of Work under Contract

The scope of work for the rehabilitation of the present plant includes: investigation of the present condition of the plant (Section 4.3), preparation of instrumentation and spare parts lists to return to a safe production, and elaboration of a work program for reconstruction in order to function normally. A further scope of the work was to include the engineering and technical details of a meat extract plant including flow sheet, layout cost sheet and specifications (Section 8.7), and elaborating on a work schedule and staff training (Sections 5.5 and 5.7). Finally, the overall plant modernization is considered in regard to layout, condition, staff, by-product utilization, maintenance, and production program (Section 5.3) with definite recommendations in regard to the final modernization (Section 6.2), the use of soya protein and meat extracts (Section 6.5), and with an elaboration and analysis of the economic aspects (Sections 8.3 and 5.3) with a work schedule program and specific recommendations (Section 6.2).

In summary, the purpose of the work was to determine and recommend, with supporting data, what should be done with: (1) the Medias Plant, (2) an extract plant, and (3) the uses of soya protein in meat.

### 3.2 Additional Scope of Work

At the mid-point of the study, it was decided by all concerned that because of the inadvisability of putting large amounts of money into rehabilitating the 70-year old plant and the need for an inspection-approved plant for export, the scope of the work would be broadened to include a feasibility study with layouts and economic data of a complete new plant in the Medias area on higher ground.

#### 4.0 DESCRIPTION

In general, this section describes the work that was performed. It also describes the overall Romanian meat industry in comparison to other world producers; the Medias "Salconserv" plant at present, and as it is planned and recommended for the future. A future pilot extract plant is engineered and the soybean protein usage program is also discussed.

#### 4.1 Work Performed

The work performed thus far consists of 45 working days in Romania by the Arthur G. McKee's technical advisor, Louis L. Crawford and three days of briefing in Vienna, as well as many man-days in the month of October making drawings and the initial designs of the new plant.

In Romania the work consisted of visiting the following meat plants: Medias, Sibiu, Deva, Brasov, Bucharest Timisoara, Galati, Constanta, and Hatag. The refrigeration and meat-packing machinery manufacturer, TECHNOFRIG, in Cluj was visited, as well as the Bucharest can-making company and the Maisesti gelatin phosphate manufacturing company. Also, several informal visits were made to the local abattoirs in various cities to compare their facilities with those of the export plants.

This plant visitation work was primarily to understand the technical level of the present meat industry in Romania and have a feeling for the inspection of processing procedures and the general level of competence.

Also, careful attention was given to the various construction procedures, not only in quality of workmanship, but in quality of available supplies.

Ten tables, two charts and one of two layouts for the new extract plant were made. This work was then summarized and documented in the included one-hundred page report.

In addition to this work, several meetings were held with the Ministry of Food Research regarding the soybean problems. Several questions were answered, and the method for analysis of soybean products in meat was submitted.

It is hoped that through this work a nucleus would be formed to build a new plant for Medias which would incorporate the extract plant in its general operations.

The details supplied on the extract plant are actually sufficient to begin working and installation.

#### 4.2 General Meat Industry in Comparison to Other World Producers

In general, it is thought that the Romanian meat industry is technically very sophisticated and now is making some of the best processed meat in the world. The salami has a high degree of consistency and quality, and this is also true of their products for export; the canned ham and pork loins cannot be surpassed by the Poles and Danes. The level of sanitation varies, as will be discussed later in this report.

The general plans of the Meat Ministry are to build 11 meat plants within the next five-year future. Two of these plants, Galati and Suceava, were inaugurated in the fall of 1971. The new canning plant in Constanta is only a few years old, and the Bucharest huge sausage plant was also inaugurated in 1971. These plants show a high degree of technical knowledge in design and construction of meat plants; however, they tend to be larger than necessary. The reason for this is that money is allotted, not only for the present capacity of the

plant, but also for its expansion; the plant is built for a five-year future. This policy is questioned as it leads to oversized, overexpensive plants. It would be better if provisions were made for an expansion of the plant when needed, and build the plant for its present capacity plus 20 percent.

Also, the construction of the plant is not made according to the drawings and specifications. Either that, or the specifications are loose and there is little inspection. Many times, because of the urgency to complete a plant, approval has to be given to items such as floors where there is no proper drainage, even though they may have a 1:100 slope. More attention should be given to the details by the contractors, and the Food Ministry should insist that the specifications be followed.

In general, though, the plants are of high quality, especially the one in Suceava.

It is difficult to determine what happens to the inedible by-products. Apparently most of them are shipped to Marasesti where they are made into gelatin or fertilizer. This is an expensive haul and probably not worth the cost, although the purchase price of about \$0.15 a pound is high when figuring the final use of the product and the cost of hauling.

In general, the cutting floors could use more cooling and refrigeration and less windows for sanitary purposes. The grounds around most of the plants are well kept and sanitary. The workers' welfare facilities do not meet the U.S.A. standards, but do meet most of those of the European countries. Some simple changes can be made in the plants for which U.S.A. approval is needed.

#### 4.3 Medias Plant "Salconserv" at Present

In general, the Medias plant is in no condition to be rebuilt; it has passed over the point where it can be made sanitary with a moderate amount of changes.

The floods reached approximately three meters in most of the buildings, which due to their construction 60 years ago, also has destroyed some of the foundations. There are large cracks in the foundations, both in the curing cellar and the outside street wall of the cutting room. Some of the tile is cracked off and the curing cellar should not be used.

There are very few floor drains in the building and practically no slope on many of the floors, so the water pools throughout the plant.

Although many of the walls are tiled, they are still in poor shape. It is apparent that the walls, ceilings, and floors in each of the rooms in which meat is processed will have to be replaced. For replacing the floors, it will be necessary to install more drains; in every meat room there is a need for better plumbing; there is no hot water system in much of the area, which means that a whole hot water system is needed. More steam needs to be added so that hot water must be available in each room. In general, all doors and door frames where meat passes must be replaced with stainless steel.

In the coolers there is insufficient refrigeration to bring down the temperature of the product that has warmed up in any reasonable length of time. There are two good compressors, but the evaporators are in poor shape in both coolers. There is no refrigeration in the balance of the plant, which will have to be added. Additional compressor capacity is needed as well as evaporator capacity.

The lighting throughout the plant is substandard and will have to be increased, which means new wiring throughout.

The window treatment is poor and some of the windows have no screens, but more important, all the windowsills are horizontal, and most foreign regulations require them to be on a 45-degree angle. Probably the best thing to do, if the plant is to continue operating, would be to close off the windows and put in artificial ventilation. Particularly, the cutting room has to be insulated and chilled to 45 to 50 degrees instead of being heated as at present.

A complete new cutting table is needed as the present one would be considered unsanitary by most meat inspection departments.

The cooler capacity is totally inadequate.

Exhibit 9.8 is a detail of the entire plant grounds.

In exhibit 8.2.1 a list of the amount of the expenditures required in each room is included by category or type of improvement needed. These expenditures will come to a total of US \$ 70,000 for the sausage plant and another US \$100,000 for the Sibiu salami plant.

The Sibiu salami plant is even in poorer shape in many ways, as there is practically no water supplied for the clean-up, and the walls in the meat preparation room are flaking and in extremely bad condition. Many rooms are much too small. In some cases there is no room for meat storage before processing. There is insufficient hot water and insufficient compressor capacity.

In general, the lighting in the Sibiu plant is sufficient, and the Sibiu salami stuffing line is in excellent condition, but the building conditions are bad. Foundations have been made out of soft brick. The plant has been flooded several times in its history.

In both plants the toilet and personnel dressing rooms are totally insufficient and would require changes as far as U.S. inspection laws are concerned; perhaps not as far as the German and English standards are concerned, as they are not as definite on the subject.

If it is decided that because of the lack of funds the plant must be rebuilt for processing meat for export, then every wall, every ceiling, every floor should be refinished, as well as the lighting and plumbing; this, of course, is not recommended. The plant is still on a flood area and subject to additional floods.

The roof and certain sections of the plant must be improved, but in general, they are satisfactory. The grounds must be cleaned up to pass inspection and a new gate put on the rear. In general, those areas in the southside of the plant which are unpaved would be paved, as this is an open inspection area.

The rendering pick-up area must be cleaned up and improved so that it does not have meat sitting around for rat and rodent infestation.

The walls in the Sibiu salami storage area must be refinished and more lighting installed.

The Sibiu salami plant for smoking must be changed entirely and cleaned up with the tile walls and windows, as well as the storage area.

#### 4.4 Future Plant - Meat Canning

This new plant is detailed in two drawings in Section 8.3, and the data on them is available on Section 8.4.

The plant site, more or less, already has been layed aside and picked, and it is excellent. It is flat ground, of which 4.1 hectares are needed with an entrance gate in the center facing the present road.

The stockyards are a half-mile away from the present dairy, which is more than adequate.

Trucks enter one gate, dirty trucks with cattle circulate to the left where they unload the cattle, wash the trucks, weigh the trucks empty, as well as full, and then return out the front gate. Clean trucks turn to the right where they are washed, loaded and returned out the front gate.

There is a rendering plant and sanitary slaughterhouse shown on the back of the plant to the north, which can or cannot be used, depending upon the local rendering situation at the time. At present, it is recommended that if money is available this plant be installed with an operation to make meatmeal and inedible tallow for the soapers.

The plant is basically a one-floor plant with a mezzanine, or second floor, over the front part of the building. The basic ceiling height is approximately 23 feet.

Kill floors, with the mezzanine area over the cutting and sausage factory area, means that each floor would be approximately 11 feet.

The plant has approximately 8,400 meters of floor space, much of which is allocated to Sibiu salami. This is an extremely expensive item to manufacture, but also the profit margin is extremely high--being almost 100 percent.

The new plant is designed for 100 cattle, 200 to 400 hogs per day; 5000 tons of conserves, 4000 tons of sausage, and 350 tons of Sibiu salami per year. These cattle slaughtering figures are based on the maximum slaughter rate available from the present supply of cattle and hogs, which is really not high enough to supply the top rates, but high enough to supply the lower rates of slaughter. It is planned that this slaughterhouse not only will take over the slaughtering projects of Sibiu, but also Medias, for the local consumption as well as for the two canning plants.

The cost of equipment for a 150-cattle-per-day plant is the same as a 50-cattle-per-day plant. The same is true of the hog plant. Eight hundred per day has the same equipment as 200 per day. The minimum rate can be slaughtered just as easily as the top rate.

The equipment cost is just the same as is the space; the difference is in the amount of pig and cattle storage area, but these are kept to a minimum in this case because the slaughtering for the local consumption would not need chill rooms, but will be shipped warm.

The plant is scheduled for a ten-meter column center, which is large; but since there is little weight loading on the upper floor, it was expected that this would be a fairly economical base center to use. The final design of it, of course, can be changed.

The design of the building is all in accordance with the U.S.D.A. Handbook 191, Guide to Architects and Designing of Meat Packing Plants. These specifications in general seem to be adequate for all countries with minor changes. It is the most popular handbook written on the subject, and therefore, the specifications generally are taken over throughout the world.

In general, the construction can be similar to the Suceava plant and must have the same floor covering, which is ribbed tile with a polyethylene sealer in the grout. All the lights must be covered and fluorescent in most areas to cut down the heat load.

All doors and door frames are to be covered with stainless steel, and 1:50 slope on the floors to the drains. Drains should be included every 50 to 75 square meters. Hot and cold water should be supplied. Hose connections every 300 meters, or in every small room.

The cattle and hog storage are separate from the plant so that there is room for expansion in the future, if needed, but yet close enough so it is economical to feed the livestock into the proper chutes.

There are two shipping areas: one for the canned sausage and Sibiu products, and the other for the fresh meat going directly to the local trade without refrigeration. Empty cans are stored on the top floor over the canning department, which has a can washing area and a freezer.

After much consideration, it was decided that the can-making facilities would be located more suitably in Sibiu, with the cans being shipped to Medias from Sibiu, and meat shipped in the same trucks back to Sibiu from Medias. The reason for this is that the can-making department in Medias is so small that it is difficult to maintain a complete machine shop, and therefore, keep the machines running. The same machines can be kept in better repair and be better maintained with better dies, so that the cans improve by locating them in a better can-making shop, such as that in Sibiu. There is room in Sibiu plant for this operation.

#### 4.5 Future Pilot Extract Plant

The drawings and the data for this future pilot extract plant appear in Data, Sections 8.6 and 8.7.

The beef extract operations is to be located in the top floor near the Konti cooker in the Sibiu plant. This is an extremely good location as it is close to the steam supply, has adequate electricity, and good ventilation. Even though it is on the second floor, this structure is strong enough to support the load; furthermore, it is close to the Konti cooker and close to the outside where the material from the Medias plant can be pumped.

Beef extract is the concentrated cooking waters from the cooking of beef and beef variety meats. In this process of cooking these products in water, much of the nitrogenous material is protein that goes into a solution in water which is called "soup," and is then concentrated by evaporation under vacuum.

Beef extract is stimulating, easy to digest and very palatable, especially when flavored with different condiments.

It can be used in the manufacture of dry soups or sold directly, as it is in England, for spreading on bread, as butter. In other words, it is a healthful, high protein, finished product; consumer item as such, and can be used to make beef tea by the housewife, or it can be added to dry soups if further dried locally. It has an export value of anywhere from 35 cents to 1.5 dollar a pound and fluctuates widely on the international market. It is assumed that most of it will be consumed locally.

The waters that are ordinarily concentrated for the manufacture of beef extract are those from the cooking of beef in the course of the canning process. This soup has about 1.5 to 3 percent protein in it at the time. The method of cooking in the process of canning is the same, whether or not the cooking water is intended for manufacture of beef extract later. Cooking is usually carried on at a temperature of 200 degrees fahrenheit, for four to seven hours, or it can be done continuously on a Konti cooker, which is a revolving drum with hot water sprays. Some plants separate the different waters, making different grades of beef extract, while others use other different grades in the manufacture of one common product. This is what is recommended for Sibiu and Medias.

In the preparation of beef extract, it is customary to use the same water for cooking three to four batches of meat in a continuous cooker. This means that the recycling of the water is done until about a three percent concentration is built up in it. This saves in the steam consumption. The waters gradually become richer as they pass from batch to batch where recirculated. After sufficient cooking water has been accumulated for concentration, it is pumped into a heating vat and heated under pressure to approximately 180 to 212 degrees. At this point, after ten to twenty minutes, depending upon the extract temperature, or until they are albuminous matter, the water raises to the surface and becomes solid. This liquid, with the albuminous solids, is next pumped through a recessed plate, open-delivery, filter press, the albumin acting as a filtering medium to coat the press. This is similar to lard filtering.

All foam matter is filtered out and the result of the filtrate will be clear and brilliant. From the the filter press the clear, filtered, liquid is pumped into a vacuum, pan-type evaporator. Because this is a pilot plant, and considering the low cost of steam, single-evaporators are being used rather than the double-effect evaporators, where vacuums of 27 inches or higher are obtained.

If the multiple-effect evaporators were used, the first effect would require relatively low vacuum. The liquid is delivered to the vacuum pan at about 180 degrees. With the boiling point of water under a 27-inch vacuum being 108 degrees, there will a lively boiling as soon as such a vacuum is secured. The lively

boiling is constantly maintained by passing low pressure or exhaust steam through the heating elements in the evaporators. Boiling at this point causes the moisture to distill off rapidly. The moisture is condensed in a condenser connected to the evaporating units for that purpose.

Such distillation of moisture proceeds until the water content is reduced to about 60 to 70 percent of the total weight. This concentration corresponds to a specific gravity of 15 degrees Ré. Eighty pounds of moisture are evaporated for every 100 pounds of green cooking. In the vacuum pumps the concentrated liquid is transferred to a stainless steel open pan, actually three meters long by 1.5 meters wide with a revolving stainless steel spiral in it. The spiral has steam at two atmospheres pressure and the product is further concentrated until it is almost a solid with a moisture content of about 22 percent.

Then it is packaged either in cans or jars, depending upon how it is to be sold. If it is sold in bulk, it is sold in 56 pound cans-- two cans to a wooden box; jars might be two to three ounces. These cans are standard five-gallon cans with a plug top two inches in diameter soldered into place. There is no vacuum on the can. Since production is low, one can per hour, the filling and can making is done by hand. Some experimentation has been done by using a plastic five-gallon gasoline container, similar to that made in Romania, but it is not accepted as standard as yet. The solid extract is the basis for the bouillon cubes, broths, soups, as well for the housewife's best condiment.

Bone extract can also be made, primarily from the hog head bones cooked in Medias. The process is much the same as the beef extract process, except for the fact that it is not concentrated as much. In other words, the final concentration phase is not utilized. Beef extract is defined by the U.S. Military departments and the Department of Agriculture, and may be imported or may originate in domestic establishments regularly operated under the supervision of the meat inspection division. The U.S. imported beef extract or bone extract, by law, should be subject to the current regulations of the meat inspection division of the U.S. Government. Beef extract shall contain not more than 18 percent moisture, not more than 25 percent ash, not more than five percent salt, seven percent total creatin and creatinin, and not less than eight percent total nitrogen.

The beef extract shall show no traces of nitrates or nitrites when tested and specified in the regulations. Other than this constitution, the beef extract shall have a characteristic flavor and odor, and shall not be scorched or burned.

Fluid extract, or bone extract, of the meat shall contain not more than 50 percent moisture, and preferably shall contain only 33 percent moisture, 12 percent salt, and the balance of bone solids.

The meat and bone extract plant, although a pilot size, can be duplicated in other plants in Romania. It is large enough to take the product in one shift from one shift of the Sibiu or Medias plant production. It is thoroughly described in the data drawings and specifications to the extent that the work can be ordered and final detailed drawings made for installation.

#### 4.6 Soya Protein Usage

The description of the soya protein usage is provided in Appendix 9.1, and the methods are given for at least five different products. In the data given in Section 8.5, the type of soya is defined and described.

Most of the soya in the United States is concentrate, and not flour. The flour in Romania is made with expeller process in milling from the original steam water extraction and pressing operation. This flour is not used in the United States because of the scorching in the expeller, and it does not have the protein solubility. The present method of mixing the flour with the meat is an excellent one, and probably the best way to be done in Romania where the silent cutters are small, underpowered, and there is little control.

In the United States, the soya concentrate is merely mixed in powder form with the rough cutting of the beef in the beginning of the chopping operation. It is sprinkled on top of the rough meat as it revolves around the chopper immediately in the beginning, similar to the condiments. However, because the flour does not go into solution emulsion as fast as the concentrate does, it is important for the Romanians to continue adding their flour in the present manner. This is to take one kilo of flour, one kilo of water, one kilo of fat and emulsify them, mixing them together, allowing them to sit for six to eight hours, and then adding the proper amount, up to 3.5 percent flour to meat into the silent cutter as a stiff emulsion. The difficulty is that this emulsion is so stiff that, in several cases, the silent cutters are not strong enough to get good mixing within the time allowed them.

## 5.0 DISCUSSION

In any general discussion, it is necessary to state that the opinions expressed are based on the engineering data available at the time, but if sufficient additional input of information is made, these opinions could be changed.

The rehabilitation of the old plant should only take place if all possible methods of financing have been considered for building an entirely new plant. The second choice would be to maintain the present plant as is for five to ten years, until it deteriorates, and then close it. The least desirable choice open would be to rehabilitate the present plant.

The basic other opinions expressed are on less important matters and do not need further discussion, as the engineering input is concise.

### 5.1 Rehabilitation of the Existing Plant

The rehabilitation at the present time, a minimum operation, already has been completed to a large extent.

The plant is operating at about three-quarter capacity set for it as of 1970, before the flood. It is operating in unsanitary conditions, but to the best of the ability of the personnel involved. One of the principal advantages of locating a plant in the Medias area is that the personnel have been trained throughout generations, by father to son. The Medias area has a strong heritage for good meat products and probably is one of the best in Romania for exporting products to other countries.

The true value of any plant is its employees and technical background. Medias has this, but they lack a plant. The rehabilitation of the plant is as best as it could be at the present time. Except for the silent cutter, which is extremely needed in order to get a better blending of the soya protein into the product and obtain a more uniform product, the plant is reasonably current in technology.

The controls that were suggested for the smokehouses and the canning equipment in September were repaired in October, so they are in adequate conditions at the present time. The canning machinery that was broken down in September has had a complete overhaul and is operating reasonably well. These changes are no longer needed.

However, the silent cutter is needed as it would upgrade the quality of the product. The actual silent cutter recommended appears on 6.1 as a money commitment. All profits are before taxes.

There is still much to be done if the plant is to continue operating in Medias as is. A normal maintenance program will keep it in an operable condition for local consumption, but not for export.

However, the need for export income is great in Romania, and one of the best places to obtain this export income is from sophisticated meat products such as pork paté, Sibiu salami, and other canned products with a margin profit as shown in Exhibits 9.6 and 9.9, which are actual data.

Margins of profit are good, particularly in the canning department, far greater than in most countries. These margins of profit are based on the local consumption, and it is understood that in export the margin of profit would be even greater. An arbitrary breakdown between the cost price and the selling price to the housewife is made of 60 percent for manufacturing and 40 percent for sales.

#### 5.2 Meat Extract Pilot Plant

It was decided to locate the meat extract plant in Sibiu. As a pilot plant, it would be able to take both kinds of products there, and there is more beef extract than there is pork soup. Also, the location is better in the Sibiu plant. Since both plants are operated by the same management and controlled by the same group, a dual facility in Sibiu could be operated much better than in Medias. Furthermore, the steam supply in Sibiu is more sufficient. The system utilized is the one used in South America for making most of the corned beef extract, and is one of the simplest. Most of the equipment needed could be made in Romania.

The plant would cost about \$45,000--maximum. Equipment totalling \$17,000 will be made in Romania. The installation and start-up costs are \$15,000.

The plant would yield approximately \$35,000 worth of gross profit per year with a \$30,000 net profit after steam cost, manpower and depreciation is deducted. This gives a pay-off period of 1.6 years. The total cost, including installation, is about \$51,000; such of this depends on where the equipment is purchased, either in the United States or in Germany. Costs are figured on the value of \$700 per ton for the extract, which is a general market price over the past five years. The return on investment of 1.6 years is a good one, and therefore, the investment should be made regardless of the availability of outside capital. It certainly could be paid for by exporting the extract. These calculations do not include the usage of Medias soupstock, which would decrease the return on investment to probably less than a year, or overtime operations on second shifts. The bonestock probably will have to be used in Romania, as there is no export value on it at the present time--except for some individual purchasers, such as Campbell Soup, the largest soup-making company in the world. There is no real export trade value of pork soupstock.

#### 6.3 Overall Modernization of the Factory

It is difficult to determine entirely which option to proceed with, but the overall evidence is overwhelming to the fact that the present Medias plant is incapable of being rebuilt. From the engineering estimates, it would be close to \$500,000 in building changes, and another \$150,000 to \$200,000 worth of equipment. The current value of present equipment in the Medias plant is \$250,000 to \$300,000, and can be transferred to the new Medias plant.

Also, the new Medias plant that serves several other functions would eliminate the present slaughterhouse in Medias, which is in extremely poor condition, although well painted on the outside. It would allow this property, which is in the center of the city, to be utilized for more important functions, as well as the rebuilding of a new slaughterhouse outside of Medias, allowing the present "Salconserv" factory area to be utilized for a more important function. Furthermore, there is no insurance that there would not be a further flood in the area.

One of the major difficulties in trying to rebuild the Medias plant would be to keep it operating while rebuilding it. An entirely new cooler would have to be built somewhere, probably in the present can storage area. This would open up the areas where the present coolers are for additional boning.

The only building in reasonably good condition is the present canning operation. It is thought that if there is insufficient capital to build an entirely new Medias plant, a new slaughterhouse, canning and sausage factory can be built, leaving the Sibiu salami factory out of the new plant, and putting a new Sibiu sausage plant in the present canning factory. The new Sibiu salami factory occupies 1,400 square meters of very expensive construction.

The present canning plant, or the old Medias plant, can be converted into a Sibiu salami factory, as the present storage area is also available on this area. The rest of the buildings can be torn down, and this probably can be done, in a reasonably inexpensive manner, and then dispose of the present Sibiu salami plant. This is not recommended, but is a possibility. What really is recommended is to build an entirely new plant as described. These are all alternatives in case the capital is not available, or forthcoming.

In general, it would be better to have both operations under one supervision and closely controlled. The history is that one owner/brother ran the canning plant, and one the Sibiu plant. Because the brothers could not work together, the canning plants were separated. This, of course, is no longer a fact, and combining the two plants would save considerably in overhead and give a far better control.

The basic problem with rebuilding the present Medias plant is that the original layout is extremely poor. It was expanded over a 70-year period; there is no centralized storage area; no centralized receiving or dispatching, which could lead to difficulties in controlling and inaccuracies in shipping, and even to pilferage of product, much less the unsanitary conditions.

The present coolers are totally inadequate and must be rebuilt as they do not have enough refrigeration and are very unsanitary. It would be extremely unfortunate if the Medias plant had to be rebuilt. There is still the possibility that, if it were rebuilt, it would not pass government inspection no matter how much money was put into it without rebuilding it entirely.

If the can making were moved, the can storage area could be used for refrigerated warehouse for the raw meat.

The area between the smokehouses and the engine room could be filled in and the flow of the plant reversed. All of this would be far more than \$500,000 minimum that would be spent on buildings just to bring it to pass inspection.

The main advantage of the new plant is that it also would allow slaughtering for the Sibiu operation, thus allowing the plant to export. At present, neither of the plants can export because the product is not slaughtered in a sanitary plant. It would supply sanitary meat and additional area for usage in Sibiu. Furthermore, the plant can be built without having any work stoppages in the present plant. The stoppages, because of rebuilding, would be extremely expensive. There is no possible way, without building a new cooler, of operating the plant and trying to rebuild the old coolers. If the job merely were to rebuild the old coolers, then the plant would have to stop operating for at least a period of two or three months, which is unprofitable, if not desirable.

#### 5.4 Plans for New Factory

A new factory was designed primarily because the old factory will not be able to operate much longer and should be condemned; but secondarily, the new plant in itself is an extremely profitable proposition. The chance to obtain an export market, which is not opened to the Medias area at present, is a major one. Furthermore, the labor savings in the new factory would be significant as well. The sanitary conditions would improve the quality of the meat and avoid meat spoilage.

The plant was designed to be as small as possible and still have the variability of products that is necessary. The rate of capacity can be increased by 20 percent or more, if necessary.

The Table 8.4.6 and its accompanying charts show what can be done with product mix at various production levels, from 4,000 tons of sausage to 8,000 tons of sausage. By cutting down on the canned products, the profit margin is lower. In other words, if the people are supplied with more sausage, the canned goods are cut down, and the Sibiu salami is cut down, the profit is considerably lower. On the other hand, with the same total tonnage from the plant, if the product is increased in conserves and Sibiu salami, with an 11,000 ton production per year, it is possible to make 2.8 million dollars in a year profit before taxes. These figures are based on the actual prices and costs in Medias of all the products manufactured. Taken on three different items, the exact cost breakdown showed that the sales cost was about 40 percent of the total markup. Therefore, the 60 percent ratio manufacturing for sales was used for the actual manufacturing plant's profits. Chart 8.8 shows the variation of profit and pay-off period with a constant level of production and varying product mixes.

Production Mix #3, which is high in conserves and salami manufacturing, will pay off more rapidly than the other product mixes. Probably the production levels would go up 12,000 tons per year, which the plant is capable of producing. No profit is assumed for the slaughtering operation or transfer of slaughtered meats to Sibiu. This profit is merely figured on the basis of the tons of sausage, conserves, and Sibiu salami from the Medias Plant. This profit, even with the high depreciation rate for 20 years on the 3.0 million plant, still would be significant enough to pay for itself on a two-year period, at a normal volume. The main problem is to obtain the raw material. Perhaps in the overall planning, an increase in price of the raw material would stimulate further growth of livestock and still allow for a sufficient profit for the meat plants. This needs further investigation. The only limiting factor to this plant's profitability is the supply of raw material at a reasonable price.

The plant was designed to be a perfect jewel; small, but precise in every operation with a minimum amount of transfer of beef and by-products and yet to be completely integrated.

The construction methods are all to be compatible with the local building codes imposed; upon these would be the meat inspection codes. The cost of building by square meter is similar to the one in the United States; this may be somewhat high, compared with present building costs per square meter of some of the existing plants in Romania. However, in order to pass inspection, it would be expected that a few extras are needed over and above what is planned. Therefore, this higher cost is assumed, and it might be assumed that a 20 percent savings could be made, if absolutely necessary, on the investment by cutting down on certain items.

The equipment costs are based on West German prices. Unfortunately, some of the costs in the Romanian market are higher than on the U.S. market, even though the quality is no greater, if anything less. This means that the equipment costs are probably slightly low.

In general, though, both the capital investment cost of equipment and building should be accurate, plus or minus 15 percent.

The areas allocated for various processes are considerably larger than the present ones, but should allow for expansion. Still, they are not too large; there are 10,000 square meters worth of drying area for Sibiu salami which will allow for a year's inventory of salami. It is figured at .4 tons per square meter. However, it is expected that with the changes in the dry salami production in the next few years, this plant can produce twice as much as this if the product were put in boxes and stored, not hanging. This can be done with controlled atmosphere. However, the plant is layed out for the traditional method of producing Sibiu salami, with the alternative of ultimately going into certain minor changes which would give more tons of production per square meter.

The sausage plant is designed for a complete range of sausage, hams and bacon. It is doubtful whether this production of hams and bacon should be a multiple process and if it can be done so economically. However, the savings in space is not that great, but it is provided for in case it absolutely must be done.

The present canning equipment will be used in the new plant; a couple of new can washers and a new filler machine will be purchased, which will allow for continuous filling to reach the desired tonnage.

The present canning equipment is in reasonably good shape and there is no reason for not transferring it. It can be done very rapidly without much shut down, especially if there are two lines.

The list of equipment for the new plant, in Section 8.4.4, is not intended to be complete as far as description of each item is concerned, but are completed as to prices. This was not intended to be a complete design study, but primarily a feasibility study.

#### 5.5 Overall Meat Plant Expansion Program and Training

The overall meat expansion program in the near period is to have eleven operating meat packing plants in the cities listed previously. Ultimately, the number would probably be expanded to 25.

There is a major caution on this type of expansion, and that is that it is almost impossible to get an identical duplication of product from one plant to another. The foreign purchaser for export is constantly looking for uniformity, and in his mind, uniformity is defined as quality. The various companies in the world that operate multiple plants are constantly having this difficulty. Exact manufacturing manuals must be produced and inter-plant inspection must be carried out by staff members who are technically minded to see that

each can made in one plant is the same made in another one. Therefore, it is recommended that, in general, a smaller number of larger plants is better than a multiple number of small plants --from a quality production standpoint.

Political implications may enter into the location of the plant, as well as the supply of the raw material, which is extremely important. In general, the plant should be put where the animals are raised. Many of the roads are good in Romania, and transportation is excellent. The closer to the supply of raw material, the better.

One important factor in locating the plant is the personnel available. Wherever the technical personnel is located, then usually there is a long history of manufacturing of meat in that area, and usually for a good reason.

In building new plants, the Romanian Government should put more emphasis on the following of the specifications and the quality standard of construction, rather than the exact time schedule, which is always difficult to meet. Rushing could mean that the plants could not pass inspection because the floors do not slope properly, or because the electrical wiring systems are too light, or the full in-plant cleaning system is not installed. It is better to be a month late and correct than to have to live with an incorrect plant for a lifetime.

Also, what is important is to have good maintenance once the plant is built. In Romania the maintenance personnel of the meat plants need to be trained further. The new plants are far more complex than the old ones, with far more complicated equipment. It is suggested that a Meat Maintenance Supervisor school or class be set up for training. These people should be taken to various plants where the machinery is made and shown how to maintain this equipment as well as being taught the theory of preventive maintenance, records, and upkeep of inventory control.

A modern chief maintenance engineer of a meat plant is the heart of the plant. Preventive maintenance must be practiced to a high degree because a shut down of a machine for two or three hours could cause disasters in shipping schedules, and certainly a waste of employment. Besides this training program, it is thought that a training of two engineers from the Technofrig plant, in modern cooler room applications of evaporators and screw compressors, is desirable. Romania will benefit from this training over a period of years. Since there is only one primary manufacturer of refrigeration equipment in the country, it will help them to supply the most advanced equipment to the meat industry.

The United States is far advanced in the chilling of animals over most countries because of the long history of chilling carcasses. Most European countries did not chill animals until about 20 years ago. The overhead, or between-the-rail evaporator units, are so compact and trouble free in the United States that they should be considered for all new coolers in Romania. They lend flexibility and are easy to install. When a unit cuts out, there is still an additional unit to keep chilling so that the loss in refrigeration is minor. This insures a constant, high-quality material.

In general, the technology level of the operating personnel is very well trained as far as knowing how to make good sausage and making a good product. The sanitation level leaves something to be desired, as far as inspection procedures are concerned. Many inspection rules do not seem worthwhile, but nevertheless, they must be complied with if export to those countries is required. In general, though, the inspection requirements are sound, basic principles for sanitation, and in almost all cases, benefit the meat packer by improving the product and reducing spoilage.

#### 5.6 Soya Protein Usage

Soya protein usages are described in the Appendix as well as the methods for applying them in various other sections under DESCRIPTION.

#### 5.7 Timing Schedule for Projects

No written timing schedule charts have been made because this would tend to make the timing schedules seem to be more exact, and is not possible to set them at the present time.

The general schedule for finishing rehabilitation of the present plant should be three to six months. This means that the present plant would not pass inspection, but will continue to operate under a normal maintenance schedule. It is assumed that the silent cutter would be purchased within the next two months. The schedule for overall modernization of the present factory, which is not recommended, would be approximately a year and a half. The detailed engineering of each job should be done within six months; bids call for within two months, and the contracts let in a total of eight months. The balance will be to spread the work out to require as little work stoppage of the plant as possible.

The overall building of a new plant would require two years. The first six months should be for detailed engineering and specification writing. The next two months is for letting the bids, and the balance of four months for the construction and start-up operations.

The future pilot extract plant should be able to be completed and ready for operation within 10 to 12 months. The first three months will be spent in specification writing and ordering of the equipment; four months to receive delivery of the equipment, and the balance to install it.

The soybean flour operation has been accomplished already--as fast as it can be--considering that there is no concentrate, but merely flour in Romania. The next step is to build the soybean concentrate pilot plant which could supply the several sausage factories with a more superior product and then also be utilized in a broader range of product, as well as higher concentrations, if desired.

All these projects are worth continuing, and will show a rapid pay-off period--less than two years. If financing is not available in Romania, outside financing should be considered. Several sources are available besides UNIDO, which is able to put the two parties together, but is not able to finance any of these projects except possibly for the technical assistance.

## 6.0 RECOMMENDATIONS

### 6.1 Allocation of Present Money Commitment

It is recommended that UNIDO should consider allocation of \$18,600 of its previous commitment of \$45,000 to the Medias plant to replace the silent cutter that was destroyed in the flood. The silent cutter is needed so "Salconserv" can integrate soy protein into its sausage and improve its products. Also, \$24,000 should be allocated for the purchase of a meat extract plant to concentrate the meat soup from Medias and Sibiu.

### 6.2 Medias Canning

It is recommended that the Romanian Government proceed as soon as possible with the detailed designs and engineering for a plant, as outlined in this study, to replace the present Medias "Salconserv" operation, and that UNIDO proceed to help the Romanians find alternate financing schemes--based on export of Sibiu salami and canned paté, both products of high quality and vast demand.

### 6.3 Pilot Meat Extract Plant

It is recommended that the Romanian Government proceed to order the equipment, both local and imported, for the soup from both plants, for the installation of the pilot extract plant in the Sibiu site. The reason being that there will be a pay-off period of about two years on the investment, and it will help the Romanians provide a higher quality sausage, soup, and meat-based products.

#### 6.4 Industry in General

It is recommended that the Romanian Government, under the auspices of INIPI, send two engineers from the TEHNOPRIG Company to the United States for two months to study in detail, develop improved methods of cooler evaporator design, and develop new refrigeration techniques. Also that the Romanian Government set up a local program for development and training of maintenance supervisors for the meat and food industries under the auspices of the Food Design Institute.

#### 6.5 Soya Protein

It is recommended that the meat industry continue to add three and one-half percent flour, but at no greater level, to its sausages as proscribed in the Appendix. Also, that the research laboratory proceed with plans of financial help from INIPI on a new pilot soya concentrate plant so that new soya products can be developed to broaden and improve the general diet of the Romanian people.

## 2.0 CONCLUSIONS General

In general, the Brazos River area industry, and in particular the textile area, is sophisticated and knowledgeable in plant production. But the Salinas plant is old, ravaged by flood, and a poorly laid out operation. Therefore, a complete new plant on higher ground which would pay for itself in ten years is needed and planned, with an offset plant nearby and facilities for another usage.

In general, the Brazosians have three choices: (1) to build a new sanitary plant for higher production in order to meet all sanitary requirements for \$1,500,000; (2) to leave the present plant as is with normal maintenance at \$20,000 per year; and (3) to rebuild the present plant with little improvement in quality of production for \$200,000.

### 3.0 Rehabilitation of the Existing Processing Plant

Rehabilitation of the existing plant already has taken place over the past year since the first discussions with WPH. In fact, the results of the re-rolling machinery, the instrumentation of the rolling process, and the catchment tank placed in October 1971 between the time of the first recommendation and completion of this work.

At the present time, the plant is rehabilitated about as far as possible without entering into a massive million dollar program as outlined in Section 1.1.

A two hundred pound Elliot roller with a 30 horsepower motor drive imported at a cost of \$18,000 from the West German is the most important need at present to be able to add some consistency to improve the quality of the product.

## 2.2 Plans for Meat Extract Pilot Plant

The extract pilot plant was designed to fit in a space of five by ten meters in the Sibiu factory, close to the corned beef Konti cooker line with a capacity to keep pace with the cooking.

The processing of the soup from the Median pork cooking will be done at night, and hauled by tank trucks the 45 kilometers to Sibiu.

The plant's imported evaporator would cost \$20,000, as specified, laved out, and processed in Section A.7. Local costs would amount to \$18,000 for additional tanks and equipment, and approximately \$14,000 for installation and building improvements. The total project cost would be \$52,000 to \$55,000. This plant would have a pay-out period of about two years from net profits, based on the past five-year average market price for extract, and a 15-year depreciation rate.

## 2.3 Overall Modernisation of the Factory

Overall modernisation of the factory would require over \$500,000 worth of building improvements (Section A.2.1), and over \$159,000 (Section A.2) of equipment in order to bring it up to a reasonable level of sanitation with a production goal of 4000 tons a year of canned meats.

When finished, the plant would still remain in a poor location, subject to floods; have insufficient cooler space; have an extremely difficult general layout--with meat moving in open spaces and all directions; and have no proper shipping and receiving rooms. Furthermore, the plant still would have difficulty in shipping "export," as the meat does not come from an "approved plant."

The present layout makes final approval of the Medias plant "doubtful" as to ever receiving final approval. If an attempt is made to overall modernization of this plant, all wall ceilings and floors would have to be resurfaced, electrical wiring redone to increase the lighting to ten watts per square meter, plumbing of hot water or steam made throughout, foundations shored on the outside walls, refrigeration increased in evaporator capacity, all doors replaced with stainless steel type doors and frames, and windows removed or given a 45 degree angle sill and proper screening. Details and cost of these changes appear in Section 8.2.1. and under DISCUSSION.

#### 7.4 *Plans for new Factory for Meat and Pilot Extract Plant*

---

Because of the difficulties of exporting sanitary meat from the Medias plant, and because Medias is an ideal location for a meat plant, a new plant costing \$3,500,000, on 4.1 hectares of land--of which \$675,000 is new equipment--is laid out, costed and profitability calculated in Sections 8.3 and 8.4.

The one-floor plant, with mezzanine, has 8,400 square meters with an additional 2,600 square meters of outlying buildings--such as pens, inedible rendering, office and maintenance. The new plant is designed for a 50 to 150 cattle a day, 100 to 800 hogs a day, 5000 tons of conservas a year, 4000 tons of sausage a year, and 350 tons of Sibiu salami a year.

There are sufficient animals in this area for this rated capacity if the present Sibiu and Medias abattoirs are closed--as they should be-- and the new plant is used for local carcass meat.

Because of the profit margin, this plant would pay for itself in about two years, without export considerations, and a zero profit for slaughtering. This pay-off period includes depreciation over 20 years, a ten percent interest on the investment, and assumes that the old plants be closed down, or completely rebuilt-- which is not advisable. Due to the rapid pay-off, this plant should be attractive to outside investors, if needed.

#### 7.5 Soya Protein Usage

Soya Protein flour, expeller made, is now being used at a level of 3.5 percent in sausage meat to enhance the binding and fat absorption of the product, and to improve the quality of the product. The flour is being mixed in the best known method for the type of soya, general condition, and type of sausage machinery available in most of the plants. Soya Concentrate is not available, except by importing.

#### 7.6 Overall Meat Plant Expansion Program and Training

The more immediate plans of the food ministry is to have 11 modern facilities for slaughtering, canning, semi conserve processing, and sausage manufacturing. Most of the facilities will be capable of exporting a portion of the products assigned to them.

As in most countries, there is an oversupply of slaughtering and processing facilities; however, there is an undersupply of sanitary and "export approved" facilities.

Since there are only five million cattle and six million pigs, the raw material side of the meat industry needs to be expanded rapidly in order to increase exports and insure something more than 36 kilos per person, per year of local meat consumption. There is a strong world demand for the high-quality, sophisticated meats that Romania is able to produce, and should produce in greater quantities for the benefit of its people and peoples of the world.

## 8.0 DATA AND DRAWINGS

### 8.1 Meat Industry in General

#### Miscellaneous Agro-economic Data #9-1971

<u>8.1.1 Animal Population</u>		<u>Romania</u>	<u>Sibiu</u>

#### 8.4 Medias Data - New Plant

##### Capacities

Cattle	50 - 200 per day
Hogs	100 - 800 per day
Canning	5000 Tons per year
Sausage	5000 Tons per year
Sibiu Salami	400 Tons per year (1.5 Tons per day)
Carcass Cooler Capacity	300 Cattle plus offal 800 Hogs plus offal
Live Cattle Storage	500 Cattle
Live Hog Storage	1500 Pigs
Sibiu Salami Storage	400 Tons
Truck Washing	2 Units
Inedible Rendering	2 - 5 Kilo Cookers
Water Storage	2 Tanks
Sewage - Primary Settling and Skimming	

8.4.1

Summary of Costs  
for  
New Medias Meat Plant

Cost of Land - 4.1 Hectares (\$5000 per Hectare)	\$	20,000
Cost of Site Improvement		36,000
Cost of Buildings		2,220,000
Cost of Equipment Installed		675,000
Total Cost		<hr/> 2,951,000
Contingencies		300,000
Start-Up Engineering		200,000
		<hr/> 3,451,000

APPENDIX ACTION BY Regional Offices and State Agencies

Textured Vegetable Protein Products (B-1) to be Used in Combination with Meat for Use in Lunches and Suppers Served Under Child Feeding Programs

Section 210.10(b)(1) of the regulations issued under the National School Lunch Program, as amended September 1, 1959, requires that meat served in school lunches and dinners for the Type A School Lunch be as follows:

Two ounces of the product as served, from a meat product which contains 10 percent of whole egg, or a product of cooked, dry beef, or peas, or a fish product, or a poultry product, or a product of soybeans, or a product of textured vegetable protein, or a combination of any two or more of the above, or a combination of any two or more of the above with the product as served.

Section 210.10(b)(4) of the regulations issued under the National School Lunch Program, as amended April 1, 1959, requires that the meat served in school lunches and dinners for the Type B School Lunch be as follows:

Attached is a specification for textured vegetable protein products which when prepared and served in combination with meat product which may be used as a meat alternate to meet part of the minimum equipment of the school lunch program as served in school lunch programs. Section 210.10(b)(1) of the regulations issued under the National School Lunch Program, as amended September 1, 1959, requires that the meat served in school lunches and dinners for the Type A School Lunch be as follows: Two ounces of the product as served, from a meat product which contains 10 percent of whole egg, or a product of cooked, dry beef, or peas, or a fish product, or a poultry product, or a product of soybeans, or a product of textured vegetable protein, or a combination of any two or more of the above, or a combination of any two or more of the above with the product as served.

The product as served shall be prepared and served in combination with meat product which may be used as a meat alternate to meet part of the minimum equipment of the school lunch program as served in school lunch programs.

The product as served shall be prepared and served in combination with meat product which may be used as a meat alternate to meet part of the minimum equipment of the school lunch program as served in school lunch programs.

The product as served shall be prepared and served in combination with meat product which may be used as a meat alternate to meet part of the minimum equipment of the school lunch program as served in school lunch programs.

The product as served shall be prepared and served in combination with meat product which may be used as a meat alternate to meet part of the minimum equipment of the school lunch program as served in school lunch programs.

MAJORITY VACUUM

MAJORITY VACUUM

MAJORITY VACUUM

1. The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that this is essential for the proper management of the organization's finances and for ensuring compliance with applicable laws and regulations. The text also notes that such records are necessary for the preparation of financial statements and for the identification of any potential areas of concern or risk.

2. The second part of the document addresses the issue of internal controls. It states that a robust system of internal controls is critical to the organization's ability to prevent and detect errors, fraud, and other forms of mismanagement. The text provides a detailed overview of the various components of an internal control system, including the segregation of duties, the authorization of transactions, and the regular review of financial data.

3. The third part of the document focuses on the role of the audit function. It explains that the audit function is responsible for providing an independent and objective assessment of the organization's financial statements and internal controls. The text also discusses the importance of maintaining a strong relationship between the audit function and the organization's management, and the need for the audit function to remain free from any potential conflicts of interest.

4. The fourth part of the document discusses the importance of transparency and communication in the financial reporting process. It states that the organization should be open and forthcoming in its disclosure of financial information, and should provide clear and concise explanations of any significant changes or trends in its financial performance. The text also emphasizes the need for the organization to maintain a strong and effective communication channel with its investors, creditors, and other stakeholders, and to ensure that all relevant parties are kept up-to-date on the organization's financial affairs.

1. The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that this is essential for the proper management of the organization's finances and for ensuring compliance with applicable laws and regulations.

2. The second part of the document outlines the specific procedures that must be followed when recording transactions. This includes the requirement that all entries be supported by appropriate documentation, such as invoices, receipts, and contracts.

3. The third part of the document discusses the role of the accounting department in the overall financial management process. It highlights the department's responsibility for providing timely and accurate financial information to management and other stakeholders.

4. The fourth part of the document addresses the issue of internal controls and the need to implement effective measures to prevent fraud and other types of financial misstatements. It suggests that a strong system of internal controls is critical to the organization's long-term success and sustainability.

5. The fifth part of the document discusses the importance of regular audits and the role of external auditors in providing an independent assessment of the organization's financial statements. It notes that audits are a key component of the organization's risk management strategy.

6. The sixth part of the document discusses the need for ongoing training and education for all employees, particularly those involved in financial reporting. It emphasizes that staying up-to-date on the latest accounting standards and regulations is essential for ensuring the accuracy and reliability of the organization's financial information.

7. The seventh part of the document discusses the importance of transparency and the need to provide clear and concise financial reports to all stakeholders. It suggests that this is essential for building trust and confidence in the organization's financial performance.

8. The eighth part of the document discusses the need for a strong corporate governance framework and the role of the board of directors in overseeing the organization's financial management. It notes that a strong governance structure is essential for ensuring the organization's long-term success and sustainability.

9. The ninth part of the document discusses the importance of maintaining accurate records of all financial transactions and the need to implement effective measures to ensure the accuracy and reliability of these records. It suggests that this is essential for the proper management of the organization's finances and for ensuring compliance with applicable laws and regulations.

10. The tenth part of the document discusses the need for ongoing monitoring and evaluation of the organization's financial management processes and the role of management in ensuring that these processes are effective and efficient. It notes that this is essential for the organization's long-term success and sustainability.

11. The eleventh part of the document discusses the importance of maintaining accurate records of all financial transactions and the need to implement effective measures to ensure the accuracy and reliability of these records. It suggests that this is essential for the proper management of the organization's finances and for ensuring compliance with applicable laws and regulations.

12. The twelfth part of the document discusses the need for ongoing monitoring and evaluation of the organization's financial management processes and the role of management in ensuring that these processes are effective and efficient. It notes that this is essential for the organization's long-term success and sustainability.

1. The first part of the document discusses the importance of maintaining accurate records of all transactions and activities. It emphasizes that this is essential for ensuring transparency and accountability in the organization's operations.

2. The second part of the document outlines the various methods and tools used to collect and analyze data. It highlights the need for consistent data collection procedures and the use of advanced analytical techniques to derive meaningful insights from the data.

3. The third part of the document focuses on the role of technology in data management and analysis. It discusses how modern software solutions can streamline data collection, storage, and analysis processes, thereby improving efficiency and accuracy.

4. The fourth part of the document addresses the challenges associated with data management, such as data quality, security, and privacy. It provides strategies to mitigate these risks and ensure that the organization's data remains reliable and secure.

5. The fifth part of the document discusses the importance of data governance and the role of a data governance committee. It emphasizes that clear policies and procedures are necessary to ensure that data is used responsibly and in compliance with relevant regulations.

6. The sixth part of the document focuses on the role of data in decision-making. It highlights that data-driven insights can help organizations identify opportunities, optimize performance, and make more informed strategic decisions.

7. The seventh part of the document discusses the importance of data literacy and the need for training and development programs. It emphasizes that all employees should have a basic understanding of data and its applications in their work.

8. The eighth part of the document discusses the importance of data security and the need for robust security measures. It highlights that organizations should implement strong security protocols to protect their data from unauthorized access and breaches.

9. The ninth part of the document discusses the importance of data privacy and the need for compliance with data protection regulations. It emphasizes that organizations should ensure that they are transparent about their data collection and processing practices and that they obtain proper consent from individuals whose data is being collected.

10. The tenth part of the document discusses the importance of data ethics and the need for organizations to consider the ethical implications of their data practices. It emphasizes that organizations should ensure that their data practices are fair, transparent, and respectful of individuals' rights.

### TEXGRAN – BEEF PATTIES

**FORMULA:**

Canner And Cutter Chuck	35 Lbs.
Flank	50 Lbs.
(Texgran	4 Lbs.
(Water	11 Lbs.
<b>TOTAL</b>	<b>100 Lbs.</b>

Add Spice If Required

**PROCEDURE:**

Generally, when Texgran is to be added to ground meat formulas, it should be hydrated and ground with the rough cuts of meat.

The recommended level (starting point) of Texgran (Code No. 10000, 10100 or 10900) in beef patties is 4% dry weight. This is hydrated with 275% cold water ( $2.75 \times 4 = 11$  pounds water). Hydrate Texgran (4 pounds) and water (11 pounds) for 15-20 minutes (mixing periodically). Then add Texgran and any excess water to rough cuts and grind through a 1/2" die, mix for 1-3 minutes and grind through a 1/8" die and patty out.

The water in Texgran can be varied from 200% to 300% depending on desired product.

The Texgran level can be increased to a maximum of 8% if some meat base flavor is added to compensate for the dilution of the natural meat flavor.

### CANNED CHILI WITH BEANS

This is a generalized formula and procedure for producing a canned Chili with Beans containing Texgran brand Textured Soy Flour.

#### FORMULA:

Water	39.00%
Red Chili Beans, cooked	28.00%
Beef, raw	25.00%
Seasonings & Flavorings, Salt & Sugar	3.25%
Starch	2.00%
TEXGRAN brand Textured Soy Flour*	1.50%
Flour, wheat or potato	1.25%
Total	100.00%

\* - Most often used Texgran code No. 52000, which is listed in the ingredient statement as "Textured Soy Flour - Caramel Color Added". Alternates, such as code No. 10000 or No. 70000, are listed only "Textured Soy Flour".

#### PROCEDURE:

1. Blanch beans to a yield of 200%.
2. Blend Texgran and salt with meat and grind to desired size.
3. Pre-blend starch and flour and a cold water slurry.
4. Add seasonings to pre-heated mixer water.
5. Add meat mix and blend slurry into mixer.
6. Heat to set starch and pump to filler.
7. Retort process canned product according to N.C.A. recommendations.

UNITED STATES DEPARTMENT OF AGRICULTURE  
CONSUMER AND MARKETING SERVICE  
WASHINGTON, D.C. 20250

May 13, 1969

Mr. David V. Le Clair  
Swift Chemical Company  
1211 West 22nd Street  
Oak Brook, Illinois 60521

Dear Mr. Le Clair:

Textured soy flour with and without coloring and flavoring is an accepted ingredient in numerous meat food products. However, as this is not an expected ingredient in many products of a meat food character, the Federal Meat Inspection Program requires special labeling to direct attention to its presence.

At present, the percent of textured soy flour permitted without special labeling statement is conducted on an ad hoc basis. Usually levels not in excess of three percent are accepted in most products without label declaration except in the ingredient statement.

As information becomes available on levels of use in various meat food products, we will advise. We are very sorry for the delay.

Sincerely,

Richard H. Alsmeyer  
Head, Standards Group  
Labels, Standards and Packaging  
Branch  
Technical Services Division

**PORK SAUSAGE FOR PATTIES OR BULK****NAME: BREAKFAST PATTIES OR PORK PATTIES****INGREDIENTS: LEAN PORK TRIMMINGS  
REGULAR PORK TRIMMINGS  
UNCLE BEMIS PURE PORK SAUSAGE SEASONING  
SWIFT'S FOOD PROTEIN (S.F.P.)  
CHOPPED OR SHAVED ICE  
WATER****PROCEDURE:**

1. WEIGH OUT 6 LBS. OF S.F.P. INTO CONTAINER.
2. ADD 4 ONE LB. BAGS OF SPICE TO DRY S.F.P., BLEND WELL BY HAND.
3. ADD 9 LBS. OF CHILLED (35 TO 40°) WATER TO S.F.P. AND SPICE MIXTURE.
4. ALLOW THE ABOVE TO SET WHILE YOU WEIGH OUT PORK TRIMMINGS.
5. WEIGH OUT 100 LBS. OF REGULAR AND 100 LBS. OF LEAN PORK TRIMMINGS.
6. GRIND THROUGH 3/8" PLATE ADDING SHAVED ICE AS GRINDING PROCESS CONTINUES. (USE 10 LBS. OF ICE PER 200 LBS. BATCH).
7. AS GRINDING PROCESS CONTINUES, SPRINKLE S.F.P. AND SPICE MIX THROUGHOUT MEAT.
8. MIX 2.5 TO 3.5 MINUTES.
9. GRIND THROUGH 1/8" PLATE.
10. HOLLYMATIC THROUGH 8 S PLATE FOR SAUSAGE PATTY.

## FORMULATION FOR FONDWURST (BRATWURST) WITH S.F.P.

**INGREDIENTS:**

50 LBS.	PORK (BOSTON BUTTS)
4 LBS.	S.F.P.
17 LBS.	WATER
1½ LBS.	SALT
1 OZ.	BLACK PEPPER
1 OZ.	MACE

**PROCEDURE:**

1. WEIGH OUT 4 LBS. OF S.F.P. INTO CONTAINER AND ADD 12 LBS. OF CHILLED (35 TO 40°) WATER.
2. WEIGH OUT 5 LBS. OF CHILLED WATER INTO SEPARATE CONTAINER AND ADD 1½ LBS. OF SALT, 1 OZ. BLACK PEPPER AND 1 OZ. OF MACE. STIR SLIGHTLY UNTIL SALT HAS DISSOLVED.
3. ALLOW THE S.F.P. AND WATER (1) AND WATER AND SALT MIXTURE (2) TO SET FOR 10 TO 15 MINUTES.
4. WEIGH OUT 50 LBS. OF PORK AND PUT ON GRINDER HOPPER.
5. ADD WATER AND SALT MIXTURE TO S.F.P. CONTAINER AND MIX SLIGHTLY BY HAND.
6. SPREAD S.F.P. MIXTURE OVER ROUGH CUTS AND GRIND THROUGH 3/8" PLATE.
7. GRIND INTO MIXER OR TRANSFER TO MIXER AND MIX FOR 1.5 TO 2.5 MINUTES.
8. STUFF MATERIAL INTO NATURAL CASING AND REFRIGERATE.

**NOTE:****ALTERNATIVE FOR STEP (5)**

INSTEAD OF ADDING WATER AND SALT MIXTURE TO S.F.P., POUR IT VERY SLOWLY INTO MIXING PROCESS AND MIX 2 TO 3 MINUTES.

## LOAVES - PICKLE AND PIMIENTO

9.9.8

30 LBS. BEEF TRIMMINGS  
50 LBS. REGULAR PORK TRIMMINGS  
10 LBS. BEEF PLATES  
10 LBS. PARTIALLY DEFATTED PORK FATTY TISSUE  
10 LBS. SWEET PICKLES  
10 LBS. PIMIENTOS OR RED PEPPERS  
3½ LBS. SALT  
12 LBS. SWIFT'S FOOD PROTEIN (S.F.P.)  
5 LBS. FRESH ONIONS  
8 OZ. GROUND WHITE PEPPER  
1 OZ. MARJORAM, GROUND  
1 OZ. FRESH GARLIC  
50 LBS. SHAVED ICE  
7/8 OZ. SODIUM ASCORBATE  
1/4 OZ. NITRITE  
3/4 OZ. NITRATE

CHOP BEEF AND ONIONS TOGETHER, AND PORK SEPARATELY, THROUGH 1/8 INCH PLATE. CUT PICKLES IN 1/4 INCH PIECES, PIMIENTOS IN 1/2 INCH PIECES. CHOP GARLIC FINE AND MIX WITH CURE. PLACE BEEF, SALT AND CURE IN SILENT CUTTER. CUT FOR 1/2 MINUTE, ADD SHAVED ICE AND S.F.P. A LITTLE AT A TIME UNTIL ALL THE S.F.P. HAS BEEN USED. THEN ADD PORK AND SEASONING, AND CHOP SO THAT THE EMULSION IS OF THE SAME CONSISTENCY AS FOR BOLOGNA. PUT MIXTURE INTO MIXER. ADD PICKLES AND PIMIENTOS. MIX WELL.

COOK, STUFF AND MOLD UNDER YOUR INDIVIDUAL CONDITIONS.

## FRANKFURTER - BOLOGNA TYPE

15 LBS. BONELESS CHUCK  
5 LBS. VEAL TRIMMINGS  
15 LBS. BEEF PLATES  
55 LBS. REGULAR PORK TRIMMINGS  
10 LBS. SPECIAL LEAN PORK TRIMMINGS  
4½ LBS. SWIFT'S FOOD PROTEIN (S.F.P.)  
30 LBS. SHAVED ICE  
3 LBS. SALT  
7 OZ. PEPPER  
2 OZ. MACE  
3 OZ. GROUND MUSTARD  
1 OZ. ONION POWDER  
1/4 OZ. GARLIC POWDER  
CURE

25 LBS. PER BOLOGNA

FINISHED PRODUCT WEIGHT WILL DEPEND UPON THE CONDITION OF THE MEATS AND THE AMOUNT OF MOISTURE ADDED.

A POINT TO REMEMBER IN USING S.F.P. IS ITS ABILITY TO BIND FAT AS WELL AS MOISTURE. THIS ABILITY REDUCES GREASING OUT AND CERTAINLY IMPROVES YIELDS.

## POLISH STYLE SAUSAGE

30 LBS.	BONELESS CHUCK	}	CURED
20 LBS.	PORK CHEEKS		
20 LBS.	LEAN PORK TRIMMINGS		
20 LBS.	REGULAR PORK TRIMMINGS		
10 LBS.	LEAN BONELESS PICNICS	}	
3 1/2 LBS.	SWIFT'S FOOD PROTEIN (S.F.P.)		
2 LBS.	FRESH ONIONS		
8 OZ.	SALT		
7 OZ.	GROUND BLACK PEPPER		
2 OZ.	GROUND MACE		
2 OZ.	GROUND CORIANDER		
5 OZ.	FRESH GARLIC		
23 LBS.	SHAVED ICE		

GRIND CHUCKS AND ONIONS THROUGH 1/8 INCH PLATE. GRIND THE OTHER MEAT PRODUCTS SEPARATELY THROUGH 3/8 INCH PLATE. CHOP GARLIC FINE AND MIX WITH SALT. PLACE BONELESS CHUCKS IN SILENT CUTTER, ADD S.F.P. AND SHAVED ICE ALTERNATELY UNTIL ALL THE S.F.P. IS USED. 23 LBS. OF SHAVED ICE IS INCORPORATED IN TOTAL.

PUT PORK MEATS INTO MIXER. ADD BEEF EMULSION AND SEASONING, MIX THOROUGHLY. STUFF INTO APPROPRIATE CELLULOSE CASINGS OR BEEF MIDDLES.

PLACE IN SMOKEHOUSE, STARTING AT 125° F. AND GRADUALLY RAISING TO 170° F. SMOKE TO DESIRED COLOR. COOK TO INTERNAL TEMPERATURE OF 152-155° F. SHOWER WITH COLD WATER TO INTERNAL TEMPERATURE OF 90° F. WHEN DRY STORE IN COOLER AT 26-30° F.

## BRAUNSCHWEIGER-LIVER STYLE SAUSAGE

25 LBS.	PORK LIVERS
25 LBS.	SKINNED PORK JOWLS
4 LBS.	SWIFT'S FOOD PROTEIN (S.F.P.)
3 LBS.	SALT
4 OZ.	ONION POWDER
6 OZ.	GROUND WHITE PEPPER
2 OZ.	GROUND GINGER
1 OZ.	GROUND MARJORAM
1 OZ.	FRESH GARLIC
4 LBS.	SHAVED ICE
1 OZ.	NITRITE
3/4 OZ.	NITRITE

GRIND PORK LIVERS THROUGH 1/8 INCH PLATE, GRIND JOWLS THROUGH 1/4 INCH PLATE. CHOP GARLIC FINE AND MIX WITH CURE.

PLACE GROUND LIVERS IN SILENT CUTTER. ADD SALT, CURE, S.F.P. AND SHAVED ICE. WHEN BUBBLES APPEAR ON SURFACE, ADD GROUND JOWLS AND SEASONINGS. CHOP FINE, STUFF INTO HOG BUNDS OR SPANIX CELLULOSE CASING OF APPROPRIATE SIZE.

COOK AT 140-160° F. FOR 1 TO 1-1/2 HOURS. CHILL QUICKLY IN ICE WATER UNTIL FIRMLY SET. SMOKE AT 90° - 120° F. UNTIL EVEN GOLDEN COLOR APPEARS.

## GROUND BEEF PROTEIN ADDED

ANY GROUND OR CHOPPED MEAT PRODUCT EITHER BULK OR PATTIED SHOULD BE CONSIDERED SATISFACTORY TO COMBINE WITH S.F.P.

THE FOLLOWING ARE SUGGESTED FORMULAS AND MIXING PROCEDURES. FORMULA #3 HAS BEEN FOUND MOST ACCEPTABLE AND FORMULA #2 SHOULD BE CONSIDERED THE MAXIMUM USAGE.

## FORMULAS:

SAMPLE	(22-25% FAT)	S.F.P./LBS.	WATER/LBS.
	BEEF/LBS.		
	25	1	3
NO. 1	84	4	12
NO. 2	100	5	15
NO. 3	100	4	12

## PROCEDURE:

1. ALLOW SWIFT'S FOOD PROTEIN TO REHYDRATE IN 400 F. WATER (AMOUNT AS INDICATED ABOVE) FOR 10 TO 15 MINUTES. (A)
2. PLACE NORMAL BLEND OF CUTS (CHUCKS, FLANKS, PLATES, TRIMMINGS, ETC.) INTO GRINDER HOPPER AND DISTRIBUTE THE REHYDRATED S.F.P. THROUGHOUT.
3. GRIND THROUGH 1/2 OR 3/8" PLATE MIXER.
4. MIX FOR 60 TO 90 SECONDS. (B)
5. GRIND THROUGH 1/8" PLATE AND BAG FOR BULK OR "HOLLYMATIC" FOR PATTIES.

(A) COLD TAP WATER WILL SUFFICE.

(B) IF MIXER IS NOT AVAILABLE, TUMBLE 3 OR 4 TIMES BY HAND.

WHEN GROUND BEEF, VEAL OR PORK IS CONDITIONED WITH S.F.P., THE END PRODUCT SHOULD:

1. BE MORE MACHINABLE IN AUTOMATIC EQUIPMENT
2. SHRINK 10 TO 15% LESS
3. HAVE IMPROVED TENDERNESS AND JUICINESS
4. BE LOWER IN TOTAL FORMULATION COST BY \$5/7/CWT.

POINTS THAT WILL HELP SELL YOUR CUSTOMERS:

1. LESS SHRINKAGE IN FRYING OR GRILLING THAN ALL MEAT PATTY.
2. PATTY IS "JUICY" RATHER THAN DRY OR TOUGH.
3. WILL NOT "WEEP" WHEN FROZEN.
4. WILL GIVE A QUALITY PATTY WITH MORE BUN COVERAGE.

REMINDER: THE LOWER THE TEMPERATURE OF THE PROCESSED MEAT, THE LONGER THE SHELF LIFE OF THE PATTY.

UNITED STATES DEPARTMENT OF AGRICULTURE  
AGRICULTURAL RESEARCH SERVICE  
MEAT INSPECTION DIVISION  
WASHINGTON 25, D.C.

ZY-  
MID-63-23  
JULY 23, 1963

TO: INSPECTORS IN CHARGE OF MEAT INSPECTION

FROM: E. A. MURPHY, CHIEF STAFF OFFICER FOR PROCEDURES  
AND REQUIREMENTS

SUBJECT: IDENTIFY AND CONTROL OF SOY BEAN DERIVATIVES

A NUMBER OF SOY BEAN DERIVATIVES HAVE BEEN PROPOSED FOR USE AS INGREDIENTS IN MEAT FOOD PRODUCTS. THE DIVISION HAS ACCEPTED SOY FLOUR, SODIUM SOY PROTEIN, SOY PROTEIN CONCENTRATE ARE THE ONLY SOY DERIVATIVES APPROVED FOR USE IN SAUSAGE. THE USE OF ISOLATED SOY PROTEIN AND SODIUM SOY PROTEIN IS RESTRICTED TO NONSPECIFIC LOAVES, IMITATION SAUSAGE, MEAT PATTIES, SOUPS, STEWS AND THE LIKE. SOY PREPARATIONS, OTHER THAN THOSE MENTIONED OR SOY DERIVATIVES HAVING A PROTEIN CONTENT OTHER THAN THAT EXPECTED FOR THESE STANDARDIZED ITEMS, HAVE NOT BEEN ACCEPTED FOR USE IN FEDERALLY INSPECTED PRODUCTS. SOYBEAN DERIVATIVES FOR WHICH THE CATEGORY OR PROTEIN CONTENT IS QUESTIONABLE SHOULD BE SUBMITTED FOR LABORATORY DETERMINATION.

SOY PROTEIN CONCENTRATE, SOY FLOUR AND ISOLATED SOY PROTEIN ARE PRACTICALLY INDISTINGUISHABLE BY VISUAL EXAMINATION. THEY MAY ALSO CLOSELY RESEMBLE SODIUM CASCIANATE, NONFAT DRY MILK AND CERTAIN CEREALS. METHODS ARE NOT AVAILABLE FOR DISTINGUISHING ISOLATED SOY PROTEIN FROM OTHER SOY DERIVATIVES IN FINISHED MEAT PRODUCTS. THEREFORE, IF THE ESTABLISHMENT STOCKS MORE THAN ONE TYPE OF SOY PRODUCT, ADDITIONAL CONTROLS ARE REQUIRED. THESE INCLUDE DEVELOPING WITH THE ESTABLISHMENT A PROCEDURE FOR CONTAINING SOY PRODUCTS FOR POSITIVE IDENTIFICATION AND MAINTAINING DAILY RECORDS SHOWING AMOUNTS OF SOYBEAN DERIVATIVES USED AND THE TYPE OF PRODUCT PREPARED.
