## CONTENTS

		<u>Paragraphs</u>
CHAPTER I	Definition of Small-Scale Industries	1 - 17
CHAPTER II	Role of Small Industries in African Economic Development	18 - 30
CHAPTER III	Perspective Lines of Development	31 - 53
CHAPTER IV	Action for Development	54 - 90
CHAPTER V	Targets	91 - 93
	Summary of major conclusions and recommendations	1 - 20
APPENDIX I	List of Industries in which small plants account for more than half the output	
APPENDIX II	List of Feasibility Studies made in India	

CHAPTER IDEFINITION OF SMALL-SCALE INDUSTRIES

1. No universally accepted definition of the term "Small-Scale Industry" exists. While some countries have defined the term, others have not.
2. In Sweden and Germany there is no official definition, but the term "Small Industry" is commonly used to denote industrial establishments having 50 employees or less. In Germany units with even upto 300 are considered small-scale. In Japan there are different criteria for different purposes; but generally speaking, an upper limit in employment, of 300 workers and of capital investment upto 10 million yen (US \$27,720) are considered as limits for Small-Scale Industries. In USA Small Business is one that is independently owned and operated and which is not dominant in its field of operations. In practice, a limit of employment of 250 workers is used to define Small Business. In India until January 1960 a Small-Scale Industry was defined as a unit with fixed capital investment of not more than Rs. 500,000 (about US \$100,000) and employment of not more than 50 workers per shift if power is used and not more than 100 workers per shift if power is not used. This was, however, changed and only a capital expenditure of Rs. 500,000 is now used as the criterion. This is relaxed upto Rs. 1,000,000 (US \$200,000) in respect of small industries working as ancillaries to large industries.
3. Countries in Africa also have no commonly accepted definition. In the UAR a unit with a capital investment of LE 10,000 (\$23,000) or total employment of less than 50 workers is considered as small scale. In the "National Income of Sudan in 1961/62" a big enterprise is considered as one with 20 employees or more and a small enterprise as one with less than 20 employees.

of 5 employees and below are deemed small and the others large. Ghana "Area Sample Survey of Small-Manufacturing Establishments - 1963" consider as small industrial establishments those with 9 or less persons engaged. The paper on Small Industry in East Africa for the Lusaka Conference of November 1965 took as its criterion units employing upto 100 workers - this is the definition used by the Stanford Research Institute.

4. While a rigid definition may not be strictly necessary for a study of small industries or for deciding on policies for their development, it might be useful to have a definition for administrative and statistical purposes in order to facilitate the compilation of data and a comparative analysis of the development of Small-Scale Industries in various countries of Africa.

5. The Cairo Symposium might consider such a definition. For purposes of this paper units employing upto 100 workers are defined as small industries. While efforts have been made to avoid taking into consideration handicraft units, it has not been possible to do so in a few cases where the statistics do not make a differentiation.

### Importance of Small-Scale Industries

6. The importance of small-scale industries in the economies of most countries - industrially advanced as well as under-developed - will be evident from a study of their relative position in the total industrial set up. In Japan, where small industries have played a major role for over a hundred years, small medium-sized enterprises in 1954 in manufacturing alone accounted for 99.7 per cent of the number of establishments (those with less than 30 persons 94.6 per cent, and those with four persons or less 59 per cent). 73.5 per cent of the number of workers and 52 per cent of the value added in that sector - (the total number of enterprises being 527,846 and workers 6,155,722 in all manufacturing establishments).
7. About 90 per cent of the industrial establishments in West Germany had less than 100 employees in 1960. They accounted for 27 per cent of the total employment in industry and contributed 23 per cent of the industrial output.
8. In the United States 271,192 out of a total of 298,182 manufacturing establishments or roughly 90 per cent had less than 100 employees. They employed 4,158,081 persons or 26 per cent of total industrial employment. The value added came to \$32,326,681,000 or 26 per cent of the total from all manufacturing establishments.
9. Small-scale industries (other than household units) are estimated in India to have been employing about 8 million people and the factory sector units to have contributed a gross output of about US \$5,000 million i.e. about 31.5 per cent of the entire factory sector production
10. Data are not available in respect of all countries in Africa. The following table gives information on a few countries.

	Rhodesia	Kenya	Ghana	Sudan	Tanga- nyika
	(1)	(2)	(3)	(4)	(5)
No. of industrial units	1046	775	4570	1508	1079
No. of units employing upto 100 (Small Ind.)	865	676	4460	1472	1039
% of (2) to (1)	82	90	97	97	96
Total employment in all mfg. units	82671	49829	50563	19708	21774
Employment in (2)	22598	15447	17678	9008	12812
% of (5) to (4)	27	31	35	46	59
Gross output of all mfg. units	£173,817,000	£74,803,000	£55.6mls	£6,637,326	
Gross output in Small-Scale Industry	£41,353,000	£23,936,960			
% of (8) to (7)	24	32			
Net output of all mfg. units	£65,615,000	£28,580,000			
Net output of small units	£16,908,000	£20.5 mls	£22,451,743		
% of (11) and (10)	25	29			

(1) According to Census of Production 1963.

(2) Figures refer to units with 5 or more employees and are taken from Census of Industrial Production 1963.

(3) Figures refer to employees using power only and are taken from Industrial Census Report 1962.

(4) Figures taken from "National Income of Sudan in 1961/62."

(5) Figures taken from "Employment and Earnings in Tanganyika 1963."

	Rhodesia	Kenya	Ghana	Sudan	Tanga- nyika
	(1)	(2)	(3)	(4)	(5)
Gross output per worker in all industries	£5885.60	£4202			
Gross output in Small Industries	£5124	£4340			
Net output per worker in all industries	£2220	£1604			
Net output per worker in Small Industries	£2105	£1554			

11. In the case of Ghana the census does not give figures of output etc., for units with below 30 workers. For units which engage 30 - 99 workers the gross output per worker in 1964 was £2094 as against £5124 in Rhodesia.

12. Only the five countries listed above in varying stages of development employed in 8512 small establishments 73,227 workers and contributed 27 to 31 per cent of gross output and 25 to 29 per cent of net output of all manufacturing industries. In the case of less developed African countries, the number of small industries and the percentage of employees and output increase sharply. It can, therefore, be concluded that small industries at the present stage of economic development of most African countries play a significant part, and, in a few, a dominant role.

13. Statistical information regarding output by small industries for all but a few African countries is lacking. The paper on "Policy Aspects of Industrial Development in Africa - Problems and Prospects" for the Cairo Symposium estimates output from manu-

(1) According to Census of Production 1963.

(2) Figures refer to units with 5 or more employees and are taken from Census of Industrial Production 1963.

(3) Figures refer to employees using power only and are taken from Industrial Census Report 1962.

(4) Figures taken from "National Income of Sudan in 1961/62."

(5) Figures taken from "Employment and Earnings in Tanganyika 1963."

facturing industries for the whole of Africa in 1963 of about US \$5400 million. Of this about 47 per cent is estimated to be light industry products such as food, clothing, beverages, tobacco, textiles, clothing, footwear, wood products, furniture, paper and paper products. Most of these industries in Africa are in the small sector although there are also large factories. The two countries for which output figures in the small-scale sector are available, viz: Rhodesia and Kenya, show a percentage of 24 and 32 as the share of small-scale production in total output excluding the household units. It is a fact that in the smaller countries this percentage goes up steeply. Assuming an average of 35 per cent, we get a gross output from the small sector of \$1800 million per year for the whole of Africa.

14. However, the picture is not uniform and 37.5 per cent of the total output originates from South Africa followed by North Africa which produces nearly 33.4 per cent. East African output is estimated at 12.5 per cent. The lowest is West Africa where it is only 8.7 per cent.

15. Employment figures in small industry for all African countries are not available. The five countries of Rhodesia, Kenya, Ghana, Sudan and Tanganyika alone employ 67,543 in the small sector. It is well known that small industries are working in fair numbers in Nigeria and North African countries particularly UAR. In Libya, for instance, out of a total of about 11,106 in 606 establishments, the number of units having more than 100 workers is only 15; the employment in small industries can be estimated at about 800. For an assessment of total employment in the small sector we have to rely on estimates, although obviously such estimates will not give an accurate picture.

16. The gross production per worker in small industry in Rhodesia is \$5124. In Kenya it is \$2740, but this represents industries with 5 or more employees only. If the gross production of units with 1-4 employees is taken, the average gross production per worker will be much considerably. In many of the regions more uneven pattern in Kenya, the gross production should be much less. In India the gross average production per worker in the small

industry is \$2047 taking the entire small-scale factory sector with 36,457 factories and 1,337,642 workers into account. If we assume this as the average for Africa, on a gross total estimated production of about \$1800 million, we get an employment in small industry of about 900,000. This is a broad estimate for which no accuracy is claimed.

17. A sector of manufacturing industry which seems to be giving employment to about 900,000 persons and a gross output of about \$1800 million reveals an unsuspectedly large magnitude and deserves close study, encouragement and assistance from governments.

## CHAPTER II

### ROLE OF SMALL INDUSTRIES IN AFRICAN ECONOMIC DEVELOPMENT

18. Increasing unemployment, especially among school leavers, has been causing concern to several African governments. The annual reports of Labour Departments of many African Governments make reference to this anxiety. Measures for combating unemployment are being attempted. The farm settlement schemes of Nigeria and the youth camps of Guinea are two examples. Small industries offer, among others, one good source of large-scale employment. Gainfully self-employed persons form an economic asset. Where small industries are developed in hundreds of thousands, the employment they give rise to can be of substantial magnitude.

19. In this connection an oriental country like Japan offers an inspiring example. In 1962 Japan employed 4,697,263 workers in 480,217 small enterprises (employing upto 100 workers). The employment in small industries in India is estimated at 8 million. What is possible in these countries may also be possible in Africa. These figures open up a vista of vast possibilities in Africa.

20. For the creation of such vast numbers of jobs the capital cost required is comparatively small in the small sector. According to the Indian census, the total fixed assets of 36,547 small units registered under the Factories Act which employed 1,337,642 workers were Rs.2115.7 million or US \$441 ml. This fixed capital works out at Rs.1580 per person employed or \$331. This may not be quite applicable to Africa, especially as India itself is manufacturing comparatively inexpensive machinery, but the figure would serve as a good illustration of the fact that with a small capital in African countries it may be quite possible to set up a large number of small industries.

21. Similarly, per given unit of productive capital small industries are found to give a much higher gross output than large ones.

According to the Industrial Census of India, while the ratio of capital to gross output in the case of large industries was 0.82:1 that in the case of small industries was only 0.36:1. Fixed capital gross output and fixed capital net output ratios estimated by a working group on small industries in India are as follows :

	<u>1961</u>	
	<u>Fixed Capital Gross Output</u>	<u>Fixed Capital Net Output</u>
Small-scale units	1: 7.27	1: 1.53
Medium-scale units	1: 4.26	1: 1.01
Large-scale units	1: 1.86	1: 0.54

22. Use of comparatively inexpensive machinery in the workers' own home instead of a specially built expensive factory, absence of other overheads of a capital nature like workers' housing, etc., largely account for this acknowledged fact. Added to this is the technological ingenuity often exercised by the small entrepreneur with lower volume machines in finding alternative ways of performing a task; the skill element makes the small proprietary firm viable.

23. In the context of African countries, with chronic shortage of capital, on the one hand, and insistent demands from several directions, on the other, such as communications, irrigation, transport and education, small industries appear to offer a good solution to the twin problems of a pressing need for higher industrial output and increasing unemployment.

24. It is not necessary in this paper to get involved in a theoretical discussion as to the economies of scale and how they affect small industries. It is, however, pertinent to refer to a study on this subject entitled "Problems of size of Plant in industry in Under-developed Countries" in "Industrialisation and

Productivity 1963". The UN Bureau of Economic Affairs after carefully comparing cost data for the glass container industry for Central America with USA concludes that "a change in technology resulting in a relatively larger input of the less costly labour factor (in under-developed countries) and a corresponding reduction of capital requirements will tend to lower the minimum capacity point".<sup>1</sup> It suggests systematic case studies in a number of industries, selected either because they are specially important to the development of the less developed areas or because they correspond to the particular needs of given regions. "Such studies would certainly show that some industries - especially those which could make more intensive use of the relatively cheap labour resources - could be established in comparatively favourable conditions and would deserve special attention".<sup>2</sup> This has great relevance to the several African countries with limited markets.

25. Large industries in Cement, Steel, Distilling, Sugar and Textiles have developed in some African countries. These are of course essential and much more development has to take place in this sphere. But almost invariably these industries have been established in large part with foreign capital and managed by expatriates. There are exceptions and in Nigeria, it is reported there are a few African "tycoons who own their own companies, sit on the boards of directors of other African or foreign-owned enterprises, and serve as a link between African governments and the modern private sector". But their numbers are strictly limited and efforts of governments and their development corporations are concentrated on attracting foreign capital and foreign entrepreneurs in large industry projects.

---

<sup>1</sup> Page 20. Industrialisation & Productivity. Bulletin No.2.

<sup>2</sup> Page 23. Industrialisation & Productivity, Bulletin No.2.

While such effort is undoubtedly necessary for African development, they do not lead to the development of the African entrepreneur - a serious drawback. In this respect small industries have a scoring point. Valuable statistical information in the Industrial Census of Ghana shows that out of 106 large establishments employing more than 100 workers in 30 different types of products, the majority was non-Ghanaian. On the other hand, in 86,809 establishments (including those working with power and without) engaging 208,340 persons in 100 types in the small sector, or 91% were wholly Ghanaian.

26. Their manufacture include food products, textiles, perfumery, cosmetics, bricks and tiles, pottery, nails, aluminium ware, machinery repairs, including automobiles, drums, and printing presses.

27. Similar figures are not available for Nigeria, but it is reported that about 25,000 Nigerians are currently self-employed in small service and manufacturing trades. There is a wide range of service and artisan trades including carpenters, electricians, painters, plumbers, shoe-makers, and proprietors of motor-repair shops; Nigerians own factories making clothing, textiles, mattresses, radios and many other manufactured goods mostly in the small sector.

28. The dark side of the picture is that many other African countries have few, if at all, African entrepreneurs even in small-scale industries, the limited current development in which field has been largely monopolised by expatriates, with of course, notable exceptions. For instance, in Senegal, among the few successful entrepreneurs are a printer, furniture maker, a bottler and an iron-monger which goes to prove that in spite of adverse circumstances, potential entrepreneurs exist and can be drawn out. In Liberia private investment is largely concentrated in residential and commercial real estates, transportation and

rubber farming. The exceptions are a few Liberian auto stations and manufacture of doors, window frames and other construction materials. In Kenya the position is worsened by the fact that, unlike Ghana and Nigeria, Africans have not been even in any but petty retail trading. Non-Africans handle more than two thirds of Tanganyika's retail business. Considerable part of Ethiopia's small industry production is due to expatriate enterprise; although there is increasing interest of late on the part of Ethiopians in small industries.

29. The position in many of the erstwhile French Colonies in West Africa is even worse. Even simple items like aluminium hollow-ware, knitting, furniture-making, cement blocks and re-constituted milk are expatriate enterprises.

30. Example of other under-developed countries points that potential entrepreneurs exist in every country and the success of Ghana and Nigeria proves that Africa is no exception. With the rapid expansion of education that is taking place, technical and otherwise, if a proper climate is created, and "discovery" of entrepreneurs and their development is institutionalised, no doubt Africa will throw up in a short space of time thousands of entrepreneurs in a variety of fields hitherto unexplored in the small industry sphere not only in Ghana and Nigeria but in the less developed countries in Africa in the sphere of small-scale industries. Small industries are an excellent primary school in industry often leading to being a stepping stone in the process of evolution of the African entrepreneur to become owner and manager of large enterprises. It should be emphasized that successful small-scale entrepreneurs are an economic asset to every African country.

### CHAPTER III

#### PERSPECTIVE LINES OF DEVELOPMENT

31. Having established that small industries have a useful contribution to make in Africa, it may be useful to explore the possible industries on which effort may be concentrated. It may at once be stated that precise studies on this subject call for feasibility studies country-wise. Small industries, like large, grow and flourish in the context of a wide variety of factors differing from country to country. Generalisations on a continental basis will obviously be difficult and subject to serious errors. In this paper only broad guide lines which may form the back-ground for further detailed study, are indicated. For this purpose we may have to fall back upon experience of countries which, like Africa, have faced problems and successfully developed small industries on a significant scale. Conditions in Africa and these countries cannot of course be identical. Chances of error to some extent can be minimised if instead of one country we take three other countries which under widely varying conditions have achieved success.

32. On the one extreme we have a highly industrialised country like USA, which has developed large industries on a colossal scale but where small industries have also developed on parallel dimensions. We may then take at the other extreme, an oriental country like Japan, which has developed small industries in an overwhelming size and over a wide field, evolving its own pattern of development. In between we have India, a country with problems in many respects similar to Africa, also new to development, where we see small industries in a gigantic process of evolution, consciously encouraged by the Government.

33. We may examine in these three countries which industries have attained in the small sector such a position that they are supplying more than 50 per cent of the gross output of particular

products in the entire economy. Such industries may have a fair chance of success in African conditions, given of course, the other basic factors essential to growth. Appendix I contains three separate lists of such items in the three countries mentioned above. The success of plants in the above three countries does not assure their success in Africa. They can be taken as candidates for detailed investigation on a country-wise pattern. We may now examine the broad techno-economic factors that appear to have been responsible for the development of small industries in these three countries and list such of them as may form perspective lines for Africa.

#### Consumer Goods

34. Small industries have everywhere been recognised as suited par excellence for the manufacture of simple consumer goods. Development in Africa so far, although without any conscious direction, has been also on this basis. Reference has already been made to how the existing output of about \$1800 million consists mostly of consumer goods. Although significant progress has been achieved in this respect, future possibilities are immense not only in countries where development is inadequate but also in countries like Ghana where about 100 types of products are already being produced on Small Scale. In this connection reference may be made to a pamphlet entitled "Choose Your Small Industry" published by Government of India listing more than 600 types of such industries. Imports of manufactured goods form a significant, although gradually declining, proportion of African imports. The following statement may be of interest :

Imports of 1963

Durable consumer goods	\$ 546,890,000
Non-durable consumer goods	1,303,443,000
Others	1,191,709,000
Miscellaneous	130,482,000
	<hr/>
	\$2,172,524,000

35. While many of the products could be manufactured on small industry basis - perhaps that is the only basis possible due to the limited character of countrywise markets - it may be modestly assumed that small industries can hope to capture about a third of the above market with a pro rata addition on account of increase in population and living standards.

36. Particular mention may be made in this connection of agro-industries. Agricultural raw material is the largest available in Africa. The need to develop, also largely centres round semi-urban rural areas, so that part of the population at present depending on land could be diverted to industry and the constant trek from the rural areas to the towns in search of gainful employment can be reduced. Agro-industries, therefore, will be the one promising sector in the consumer goods group on which effort has to be focused.

37. Another will be heavy type of products which cannot afford to bear freight charges involved in long distance transport. An example of such an industry is bricks and tiles.

38. The third will be those catering to specialised tastes, apparel for instance, adjusting to rapidly changing fashions; speciality paper catering to small markets; costume jewellery in which change of variety is an essential market demand.

### Assembly and Packing Industries

39. Units which assemble components often involve little skills and are best suited for small industries. Such instances are manufacture of footwear, tarpaulins, etc. In India a number of small units started with importing clock movements, and radio mechanism. The outer case alone was locally manufactured. Gradually the units started manufacture of some components, importing or buying from other manufacturers, the rest. Procurement in bulk and packing them for retail trade form the occupation of a number of small industries in India. This extends to cosmetics, pharmaceuticals and vegetable oils.

40. Simple processing is a minor variation of the above and forms the occupation of a number of small industries. In Nigeria, an expatriate medium-sized unit produces cotton knit-wear in bulk; under Government orders this has to be delivered to small Nigerian assemblers for conversion into garments. Polyethylene packing, tissue paper, drinking straw, paper cups and saucers, paper napkins, teleprinter paper, paper tubes, coating of plastics on cloth or paper and metallising are examples of small conversions which appear to hold prospects in Africa.

41. The bicycle and sewing machine industry are a good example of an assembly type of small industry, but in which the components are also made by various small units. It is interesting to note that not only are the products competitive and often cheaper than those made in the large sector, but some of them command export markets, testifying to their quality.

### Industrial Services

42. Enamelling, plating, galvanising and polishing of metal products are carried on in a number of small establishments in India. In Japan units with 10 to 49 employees contributed 62 per cent of the value added in electroplating, 68 per cent in metal coating,

73 per cent in heat treatment, 65 per cent in engraving, and 30 per cent in galvanising. The number of units involved is 1590 with 29,787 persons employed.

43. Small Foundries in large numbers supply grey castings for replacements at quite cheap rates to the textile industry in Ahmedabad (India). All these are good examples for Africa. Auto repairing shops have developed in substantial numbers in Africa but their numbers could expand very considerably with increased road mileage and transportation facilities.

#### Ancillary Industries

44. In Japan between the mid-twenties and mid-thirties when Japanese industries were being put on a war footing the system was developed of sub-contracting. Large industries supplied raw materials to small-scale units who converted them into components. They were assembled, finished and tested and delivered as finished goods by the large sector. Ancillary development has developed considerably in Japan in various industries such as bicycles, sewing machines, automobiles, optical and precision instruments, watches and appliances, textiles and ceramics. The following table gives an idea of the degree of dependence of the big industries on sub-contractors in terms of production costs :

Sewing machines	40 per cent
Ammunition	40 per cent
Bicycles	31 per cent
Gauges	30 per cent
Weaving machines	28 per cent
Automobiles	28 per cent
Optical and precision instruments	26 per cent
Motor cycles	25 per cent
Other industrial machines	21 per cent
Communication apparatus	20 per cent
Watches	19 per cent

Vehicles	18 per cent
Electric motors	17 per cent
Ship building	15 per cent
Electric appliances	11 per cent

45. Assistance given to sub-contractors varies considerably. It extends sometimes to special facilities for equipment to ensure the quality of parts sub-contracted and delivery on schedule. According to a survey carried out of 530 enterprises, as many as 255 received assistance in the shape of raw materials, 144 technical guidance, 140 lease of machinery, 9 interchange of personnel, 70 good offices or guarantee for loans, 37 loans for investment and 26 loans for working capital. It is stated that in June 1956 about 61 per cent of the total number of sub-contractors were receiving aid from the parent enterprises. In 1956 the average number of sub-contractors per parent industry was about 60; 52 per cent of sub-contractors were units which employed less than 30 workers and 80 per cent had capital of less than one million yen (\$2767).

46. In the USA again ancillary development has taken place on a significant scale. The degree of sub-contracting varies with the nature and size of each factory. For instance, the International Business Machine Corporation is understood to be procuring 50 to 80 per cent of their components from sub-contracting. About 40 per cent of components purchased by Chrysler Corporation are estimated to be from small units, representing about 20 to 25 per cent of the cost of each automobile. Assistance extended covers not only supply of full technical specifications and blue prints, but also on the spot technical advice by the parent firm engineers, supply of dies, fixtures, dies and tools and loan of equipment. Quality control is rigidly adhered to and sub-contractors' products not coming up to specifications are promptly rejected.

47. Ancillary development is gradually evolving in India. While machine shops, foundries, tool and pattern makers, repair shops and suppliers of components and spares in the industrialised cities of Bombay and Calcutta have grown in response to market demand, ancillary development on a conscious basis is being fostered by Government. The principal attraction in this connection is the extended definition of the term "Small-Scale Industries". The normal definition of a unit with a fixed capital of Rs.500,000 is liberalised in the case of ancillaries to Rs. one million for eligibility to supply of machines on hire purchase basis from the National Small Industries Corporation.

48. The policy of active encouragement has led not only to the establishment of sizeable number of ancillaries, but even of ancillary industrial estates attached to large units both in public and private sectors. Particular mention may be made of such an estate attached to the Government's machine tool factory in Bangalore. Ancillaries are developing in respect of the following public sector projects :

Hindustan Machine Tools, Bangalore  
Heavy Electricals, Bhopal  
Heavy Engineering Corporation, Ranchi  
Hindustan Antibiotics, Poona and Rishikesh  
Hindustan Aircrafts, Bangalore  
Bharat Electronics, Bangalore  
Radio Electric Manufacturing, Bangalore  
Indian Railways - particularly Diesel Locomotive  
Factory, Varanasi  
New Government Electric Factory  
Iron and Steel Works, Bhadravati  
Hindustan Steel, Bhilai and Durgapur

49. On the threshold of industrial development, Africa is also considering establishment of heavy industries. It is understood that proposals include projects for machine tools, heavy electrical equipment, aircraft, railway equipment and steel. It may be desirable to consider the establishment of ancillaries right at the stage of formulation of detailed proposals, and the infrastructure required.

50. Industrial licensing procedures and Government purchase programmes could be utilised as effective instruments for ancillary development. Development of ancillaries under African entrepreneurship can be made a condition precedent to the granting of licences for large units. Import licensing can also be effectively used for this purpose. USA has been, it is understood, using Government purchase policies in favour of ancillary development.

51. Africa is developing, among others, engineering colleges and technical institutes. Ancillary development programmes could be particularly adapted to the technicians coming out of such institutions.

52. Another possibility open in Africa that may not be strictly called ancillary development is for small industries producing items required by large units. Manufacture of cloth bags for the big roller flour mill in Nigeria, nuts and bolts for the aluminium corrugated sheet unit in Accra, shoe laces for the canvas shoe factory in Addis Ababa are a few of hundreds of examples. The railway systems in Africa are importing most of their spares and components, many of which could be made in small industry. Effort in painstakingly listing the thousands of requirements of private and public sector large enterprises, drawing up standard specifications, prominent exhibition of samples with information as to total requirements every year, followed up by active assistance to entrepreneurs, technical and otherwise, would be well rewarded

not only by visible development of a multitude of small-scale units but also by a drastic saving of scarce foreign exchange which could be put to import of capital goods.

### Modernisation of Traditional Manufacture

53. As pointed out earlier, Ghana has as many as 90,797 establishments working without power. Libya has 7,332 establishments with less than 5 employees each and engaging 16,012 persons. More or less the same position obtains in other African countries. The UN Publication "Industrial Growth in Africa" estimates that nearly half the present manufacturing output originates in small industries. Most of the establishments are dispersed over the entire country. With the rapid spread of electrification, many of these units which are performing essential services to the community could be mechanised and those which are working with power but on a very small scale could be expanded. Power looms in place of handlooms, power hammer for the blacksmiths and bandsaws and mechanised equipment for the rural carpenters, presses for the sheet metal workers, small power expellers to replace the hand pressing of oil are but a few of the vast possibilities in most African countries. The experience of mobile vans spreading the idea of mechanisation in the Indian countryside has been entirely satisfactory and can be adopted in Africa. If a country-wide dynamic programme is set in motion, the resulting advantages in addition to output and employment in the short run and the spread of mechanical mindedness over the country-side in the long run, finding concrete expression in myriads of workshops are bound to be considerable.

#### CHAPTER IV

#### ACTION FOR DEVELOPMENT

54. The foregoing would disclose that the future of small industries in Africa under African entrepreneurs is bright. Development would, however, be impossible unless governments forcefully realise the importance of small industries - at present there is not enough evidence to this effect - and create the necessary climate, infra-structure and facilities. A firm declaration of policy in favour of small industry development by African entrepreneurs within the overall plan for industrial development by African governments would not only remove ambiguities but be guidelines for all departmental thinking and action. Such declaration would be of great assistance in what is more or less a neglected field today. In certain African countries there is doubt as to whether the African entrepreneur in the field of small industries is to be encouraged or not and declarations of policy should remove all such doubts.

55. Most African governments have formulated investment codes offering incentives for establishment of industries. Some of these codes draw the line at a particular limit of capital; units with investments below are barred from the benefit of the incentives. Large industries being more or less the exclusive field for expatriates, the effect of such exclusion is to shut out indigenous small industry enterprise - already rare. The removal of such discrimination is strongly recommended.

56. One chief obstacle to indigenous industrial development is import from industrially-advanced nations at rates local industries find at any rate in the initial stages difficult to compete. Bulk production aided by extensive export subsidies are behind such low rates, which sometimes are tantamount to dumping. It is the policy of protection, extending often to wholesale bans on

imports, which have led to rapid development of industries, large and small, in Japan and India.

57. To prevent fall in quality consequent on elimination of competition, standards could be prescribed and enforced. Positive help to small units in producing quality goods could be given by the Small Industry Centres, which are recommended for establishment.

58. Most African markets are limited; and in many cases may not support any large industries unless on a sub-regional basis. In such a contingency exclusive reservation of certain spheres for small industries as in India may not be necessary; but government purchase policy may be adjusted to benefit small industries. The quantum of subsidy involved is small; the psychological boost to small industry is substantial. The purchase policy in USA has been used as an effective tool for encouragement of small business. The policy involves government purchases in certain items exclusively from small industries and a price preference in regard to others.

59. Development Corporations or Development Banks have been started by almost all African countries. The former not only grant loans but also participate in equity of industrial concerns; whereas the activities of the banks are restricted mostly to medium and long-term loans. There is considerable amount of divergence in regard to the working of these organisations in the various countries. In the absence of figures of loans disbursed by them to large and small industries it may be hazardous to make a statement, but the impression one gets after discussion with a number of such concerns is that their activities by and large centre round large industries and (although there are exceptions) particularly those involving foreign capital. Some Banks have fixed lower limits of £10,000 to their loans which naturally exclude many small-scale units. Others rule out loans for initial

starting of an industrial unit, but give only after its successful operation for about one year. Invariably they insist on sound security which may extend to twice the value of the loan.

60. On the whole funds do not appear to be the limiting factor but projects. While some Development Banks have organised investment promotion divisions which prepare projects and look round for entrepreneurs, the same could not be said of all Banks. But almost all of them have no technical officers on their staff and the lack of any other organisation with technical staff acts as an obstacle both in evaluation of projects as well as in preparing feasibility studies: One Bank has employed foreign consultants but most of its projects are tilted in favour of large units, involving imported capital, know-how and enterprise.

61. On the whole, no new organisation seems called for in regard to grant of loans. The pressing need appears to be to prepare a large number of sound feasibility studies and interest African entrepreneurs.

62. Money loans of course are essential, but a good variation consists of supply of machines to small industries on hire purchase basis. Hire purchase supply is not unknown in items like sewing machines and motor cars, but the arrangement proposed above of machines covers much vaster dimensions and is motivated not by private profit but of service. Supply of machines instead of cash loans eliminates chances of misuse. Above all, the overriding superiority of this scheme is that it calls for no guarantees or collaterals; the machine remains legally the property of the advancing corporation until the last instalment with interest is paid. The small entrepreneur instead of having to find mortgageable properties to the extent of twice the loan has only to find about twenty per cent as initial payment; the rest is recovered over 4 to 8 years depending on the life of the machine.

63. In India, the one country which has been working the system through a wholly government-owned corporation, the supply of machinery on hire purchase has been very successful. Incorporated early in 1955, the Corporation has a paid up capital of Rs. 5 million (about \$1.25 million) which is augmented by rupee loans from the Government of India and foreign currency loans from international organisations. From the inception of the scheme upto 31st March 1965, the Corporation delivered 14,326 machines to 4775 small units of an approximate value of Rs.216.3 million (US \$43.5 million). The machines supplied ranged from simple ones for making wire nails to complete plants for collapsible tubes, flexible pipes, paper, high precision machine tools, etc. Defaults were few; the organisation worked fully on commercial lines charging interest of 6 per cent and a service charge of 6%.

64. Such a scheme appears to be strongly called for in the present conditions of Africa with too few entrepreneurs faced by formidable barriers in the form of sound securities and the Banking institutions always cautious in their approach, made more apprehensive by too many failures.

65. Whether the existing development banks or corporations can with their present constitutions embark on hire purchase supply of machines is not by any means a difficult question. If their Memorandum and Articles or Charter do not allow, a subsidiary could be easily formed.

66. Obviously it will be unwise to develop new overhead expenditure on this activity until the system becomes fully established and justifies such expenditure on economic grounds. In the long run this system has a beneficial effect to indigenous capital goods industries, there will be a ready-made organisation to market a considerable portion of their products. There is nothing to indicate that small industries are not getting adequate working capital. But this difficulty is bound to arise with the

increase in numbers of entrepreneurs, many of them might not be "credit-worthy". In some African countries such a situation has already arisen.

57. Government guarantee of credits to small industries by commercial banks has been in force in Japan. Under the Loss Compensation system, the Government or local public bodies undertake to compensate upto a certain limit, the losses that might be incurred by financial institutions in giving loans to small and medium businesses. The compensations vary from 50 to 90 per cent with different kinds of loans. Under the Credit Guarantee Society Law of 1953, 52 Societies have been established in Japan. The functions of such societies include standing guarantee for a small or medium industry when it is given a loan by a financial institution.

58. A credit guarantee scheme in favour of small industries was introduced in India since July 1960 under which financial institutions advancing short-term or long-term loans to small units will be able to recoup part of the loss, if any, from the Reserve Bank of India. This scheme has given incentives to Commercial Banks to advance loans to small industries. The number of guarantees issued stood at 11,067 in September 1964, the amounts guaranteed totalled Rs. 427 million (US \$85 million).

59. It is necessary that African Governments examine and adopt similar schemes to remove what may become the one major obstacle to small industries achieving their set targets.

#### Industrial Estates

70. What the hire purchase scheme does by way of relief in the initial capital expenditure in purchase of plant, the industrial estate does in regard to the capital expenditure on buildings - providing built-up factory space with power, water supply, drainage, common facilities, etc., at economic and often subsidised

rents.- the industrial estate has in other countries established itself as an excellent tool for small industry development. Encompassing within a small area a diversity of active small industries, the industrial estate serves as a visible example for entrepreneurs in neighbouring areas and thus radiates knowledge leading to development in adjacent places. In India the industrial estate concept has shown phenomenal development and in ten years more than 300 estates have not only come into existence but are flourishing.

71. The industrial estate idea is not exactly new to Africa; but barring the small pilot estate in Yaba (Lagos) no industrial estate appears to have been constructed nor does there appear to be any proposal for such construction barring Mauritius which is planning one near Port Louis. But "industrial areas" have been developed by most African countries providing developed factory sites - such areas exist in Nairobi, South Africa, Rhodesia, Dar-es-Salaam, Morogors, Mwanza, Arusha, Moshi and Tanga (Tanganyika), Angola, Chad (where plots in the industrial area are reported to be given free). In Nigeria industrial areas have been completed in Kaduna, Kano, Zaria and Jos. The Trans-Amedi "Industrial Estate" in Port Harcourt, Emene near Enugu, Onitshe, and Abe in Eastern Nigeria are in various stages of development. Ikeja, Mushin, Ajeromi, Ibadan, Abeakuta, Oshogbe, Akure and Ijeba-Ode in Western Nigeria are examples of industrial areas either completed or being developed.

72. These industrial areas are not specifically earmarked for small industries, but for all - although as a matter of fact some areas like Ikeja and Apapa are all occupied by large industries only. It, therefore, comes to this that except Yaba there is no industrial estate according to the UN concept of the term which provides built-up factory space exclusively for small industries.

73. Situated on a 2<sup>3</sup>/<sub>4</sub> acre plot of land in Lagos, with 42 standard factory units, the Yaba Estate is reported to be occupied by 28 tenants with a total employment of 300 workers. The units include light industries manufacturing garments, scientific equipment, furniture and plastics. Factories are allotted on rents, which for the first five years are subsidised. The general services include power, water, watch and ward, fire protection, canteen, parking space, lavatories, and telephone services. A common facility workshop with a number of machine tools is maintained. Training is also arranged in the workshops to the managers of industrial enterprises.
74. The industrial estate as an isolated infra-structure is not likely to be effective; it has to be one among a number of other instruments for small industry development such as facilities for supply of hire purchase machines, technical assistance from small industry service institutes (as will be suggested later), easy credit facilities and preferential policy in the matter of government purchases.
75. If African governments take steps to implement these policies, the construction of industrial estates would be a major step that could be strongly recommended.
76. Such estates would best be located in the industrial areas already developed, in the vicinity of large industries. This would lead to much mutual dependence and make for the success of the estate. At the same time it would also lead to considerable economies in the matter of services such as electricity, water, and sewage. Such a course would also ensure speed in construction of the estates avoiding as it does the time consuming procedures of land acquisitions.
77. Construction of factory space in industrial estates may be planned after careful surveys and ensuring that it will be taken

up once it is constructed. This pre-supposes considerable consultation with the existing and potential small industrialists.

78. In India construction of industrial estates has been undertaken so far solely with loans provided by the Central Government to the Provincial Governments. Such loans are repayable over a period of twenty years and carry low rate of interest. It has been recognised that the small industrialist would not find it possible to pay the economic rents in the first five years of his venture and as such, provision has been made of subsidies on a graduated tapering basis by the Central to Provincial Governments. In addition some estates have offered exemption from local taxes in respect of materials coming into and moving out of the estate.

79. The industrial estate idea has become so popular in India that the need for Government funds for their construction is fast disappearing. Co-operative industrial estates are springing up with funds from institutional sources. The Life Insurance Corporation of India in the public sector and a few important insurance companies in private sector have also stepped in to provide loans for construction of estates on easy terms.

80. These are pointers to Africa. In the early stages it may be necessary for governments to find all the funds for construction, rents may have to be subsidised, tax relief may have to be given; but in a short period of time, such extraneous props may hardly be necessary and the popularity of the estates themselves and their benefit to small industry would become so well established that Co-operatives and other organisations may step in for their construction and expansion.

81. The extent of usefulness of an estate will depend not merely on the rents; but also on the service facilities it provides. It is desirable to provide a well-equipped common

facility workshop with machines that the small entrepreneur may find too expensive to procure himself. It is best to locate the small industries service institute in the estate so that the units could take advantage of the technical services of the Institute, and of its library, could participate in seminars and training schemes. In other words the Institute and industry can maintain intimate contact. It may also be useful to locate technical institutions in the estate which will provide a practical background. Labour housing schemes, if any, may also be sited near the estate. As far as possible, the estate may be near the towns so that the managers and labour do not have to travel too far to their place of work.

#### Technical Assistance

82. As mentioned earlier, the development of small industries in Africa is by no means insignificant - to make these units more efficient and to mechanise the traditional industries will involve technical assistance. A more important need in Africa is the drawing out of the entrepreneur into the small industry field. Economic surveys, identification of possible fields for development and preparation of feasibility studies are an essential preliminary.

83. These functions are best achieved by what is called the Small Industries Service Institute or Centre. In Africa such centres do not exist, but a good beginning has been made in Owerri in Eastern Nigeria where with the assistance of US AID, the Dutch Government, the Ford Foundation, the ILO, and the Regional Government, an Industrial Development Centre has started functioning recently and carrying out most of the functions above-mentioned on a comprehensive basis.

84. It is understood that the IDC contacted in 1965 more than 500 entrepreneurs. Of these 500 were selected for special assistance in IDC business and approximately 75 of this group are

reported to have made significant progress towards installing or perfecting workshops with new equipment and new production and marketing procedures. It is also stated that an additional 70 new enterprises are currently under development. The IDC is equipped with workshops for wood working, metal fabrication, auto repairs, leather working and textiles. It is understood that in U.A.R. and Morocco, such institutes are being established with funds from U.N. Special Fund, and ILO as executing agency.

85. The local government has provided the buildings, housing and furniture for personnel, maintenance of all building grounds and equipment, materials for operating the programme, Nigerian counterpart personnel and transportation and per diem for Nigerian and other (except USAID) personnel. USAID provides equipment for all workshops, transportation and per diem for USAID personnel.

86. In India "technical assistance" is regarded as the most important item in the programme for the development of small industries. 16 small industries service institutes, 5 branch institutes and 64 extension centres with a staff of more than 650 technical staff members and approximately an equal number of workshop employees, rendered technical assistance of diverse kinds to 52,896 cases, in 1963-64. Advice to start new industries was given in 24,995 cases; one of the important items of work done by this organisation, which has a great deal of relevance to Africa, is the preparation of feasibility studies for a diversity of small industries. Nearly 1100 such reports have been prepared. Many of them are printed and widely distributed free of cost. The studies disclose the capital cost, machines required, turnover and profitability. Appendix II gives a list of such studies in India which prima facie appear to have relevance to Africa. The figures are based on Indian conditions. To work out corresponding figures for the various countries in Africa would involve considerable time and effort. The list may

~~be taken purely as illustrative of what can be done.~~ Preparation of such feasibility studies on a country-wide basis in respect of the small industries which appear *prima facie* to hold possibilities for development and wide dissemination of such studies may go a long way to attract entrepreneurs.

87. The extension centres in specific industries give intensive training in items like thermometers, scientific glassware, lens grinding, machine tools, electric motors, agricultural implements, etc.

88. The institutes vary in size and staffing in accordance with the requirements and potentialities of the various areas. The recurring expenditure over each institute ranges from Rs.600,000 (£ 120,000) to about (£ 240,000) per year.

89. Once the institute is established together with hire purchase organisation, intensive campaigns can be organised. A team consisting of technical officers of the institute and of the hire purchase organisation goes to a semi-urban area which has the necessary infra-structure within their mobile vans, films of small industries and products that could be made, with printed copies of feasibility reports of industries possible in this area. Active personal contact is established with potential entrepreneurs, alternative schemes are discussed, wherever an entrepreneur shows interest in a particular project, the hire purchase application form is filled up then and there. Active follow-up is made of such cases. The result will be favourable even though it may happen that only 10 out of 100 entrepreneurs proceed beyond the stage of discussion. In Africa, such intensive campaigns are essential and may bear fruit, if not at once, gradually. Every sizeable African country which desires to initiate a small industry programme may establish at least one small industry institute. Its size and composition may depend upon the size of its small industry sector, resources available and targets for development.

90. The functions of the institute may be :

1. Advice to small units on improved technical processes and use of modern machinery;
2. Conduct of training classes in a variety of technical subjects including business management;
3. Technical assistance in development of ancillary industries;
4. Conduct of economic surveys in particular industries and areas;
5. Drawing up of feasibility studies in a large variety of industries;
6. Contacting entrepreneurs, and persuading them to take up small industries and for this purpose to undertake intensive campaigns;
7. Take up and implement quality control schemes.

## CHAPTER V

### TARGETS

91. If the government were to implement the above proposals actively and create the necessary climate, rapid development of small industries can be expected in many African countries. It might be a useful idea for each government to lay down a target for development within a particular period and to set about achieving it. Most of the development plans contain targets for the industrial sector but they have not been broken up into separate targets for small-scale sector and otherwise. It is estimated that the gross output from small industries in Africa is about £ 1800 million of employment about 900,000.

92. Excluding the highly-industrialised South Africa, the output from the rest may come to only £ 1125 million and employment 562,000. Doubling the present output and employment within five years, if possible, and definitely within ten years may be a target worth trying for.

93. This may mean a total investment of about £ 225 to £ 300 million. Part of this will come from the entrepreneurs - perhaps 30 per cent may be a rough estimate while the remaining £ 157 million may have to be found by governments. The extra working capital required of about £ 280 million may have to come from Commercial Banks.

Summary of Major Conclusions and Recommendations

1. Small industries play a significant part in the life of most African countries and in a few, a dominant role.
2. The gross output from the small industries sector in Africa may be roughly estimated at \$ 1800 million and employment about 900,000.
3. While large industries are mostly started by expatriate enterprise, small industries can mostly be owned and operated by African entrepreneurs and can also often form the stepping stone for African entrepreneurs into large industry.
4. Small industries, according to the experience of other countries, produce per given unit of capital greater output and employment than medium and large units. Small industries appear to offer a good solution to African countries in the context of shortage of capital and the need for employment.
5. Industries listed in Appendix I & II may be taken as candidates for detailed investigation on a country-wide basis.
6. Consumer goods, assembly and packing industries, industries performing industrial services and auxiliary industries have good scope in the small sector. Modernisation of traditional industries is another direction for development of small industries.
7. Policy declarations by African governments in favour of development of small industries with African entrepreneurs would be helpful.
8. Discriminatory regulations which go against small industry development may be removed.

9. Protection at least in the first few years is essential for small industry development.
10. Government purchase policies may be adjusted to help the small sector.
11. Feasible projects and not money appear to be the principal handicap to small industry development in Africa.
12. Development Banks or Corporations may take up by themselves or through subsidiaries the supply of machines to small industries on hire purchase basis.
13. A system of guarantee by governments against possible losses by commercial banks may be essential for rapid development of small industries.
14. With other instruments like the system of supply of machines on hire purchase basis, technical assistance, preference in government purchases, etc., industrial estates may be an effective tool for small industry development in Africa.
15. Industrial Estates may preferably be located in the industrial areas.
16. In the initial stages the entire funds for construction of the estates may have to come from governments.
17. Each sizeable African country which wants to initiate a small industry development programme should have a small industry service institute.
18. Intensive campaigns to draw out and persuade entrepreneurs to take up small industries will be considerably beneficial.
19. A target of doubling the present output and employment in about 5 years if possible and definitely in 10 years may be a target worth attempting.

20. It would be desirable to attempt a definition of the term "Small Scale Industry" in Africa.

APPENDIX I

LIST OF INDUSTRIES IN WHICH SMALL PLANTS ACCOUNT  
FOR MORE THAN HALF THE OUTPUT

I N D I A

1. Separable and Specialized tasks -

Iron and steel castings and forgings

Cutlery, locks, etc.

Hurricane lanterns

Sanitary and plumbing fixtures and fittings

Weights, metal fittings, domestic utensils, welding electrodes,  
other metal products.

Household electric appliances (heaters, irons, etc.)

Surgical instruments

Scientific instruments

Buttons

Plastic molded goods

2. Simple Assembly, Mixing or Finishing Operations

Cocoa, chocolate, confectionery products

Textile dyeing, bleaching, finishing

Knitting mills

Cordage, rope, twine

Gas mantles

Tarpaulins, tents, sail, other canvas goods

Footwear, except rubber

Clothing

Umbrella

Leather products, except footwear and apparel

Explosives, including gunpowder and safety fuses

Insecticides, weedicides, fungicides

Soaps and glycerine

Perfumes, cosmetics, other toilet preparations.

Pencil and pen  
Brooms and brushes  
Games and Sports goods  
Toys

3. Service Industries -

Printing, publishing, allied industries  
Enamelling, japaning, lacquering, galvanising, plating,  
polishing.  
Type founding  
Welding  
Repair of motor vehicles  
Wrapping, packing and filling of articles

4. Plants serving local markets -

Soft drinks and carbonated water  
Wooden and cane containers and small ware  
Joinery and general wood-working  
Wooden furniture  
Paper for packaging  
Fertilizer mixing  
Bricks  
Tiles  
Hume pipes and other concrete products (including reinforced  
products)  
Metal container and steel trunks  
Agricultural implements  
Boat building

5. Processors of dispersed resources

Canning and preservation of fruits and vegetables  
Canning and preservation of fish and other seafoods  
Flour mills  
Rice Mills

Dal Mills  
Gur  
Edible oils, except hydrogenated  
Tea manufacture  
Coffee curing works  
Saw milling  
Tanneries and leather finishing  
Vegetable and animal oils and fats (except edible oils)  
Stone dressing and crushing

6. Products with small or segmented markets

Chemical machinery  
Construction machinery  
Oil mill machinery  
Rice, dal, and flour mill machinery  
Size reduction equipment  
Conveying equipment  
Mixers and reactors  
Refrigeration plants for industrial use  
Fire-fighting equipment and apparatus  
Earth-moving equipment (scrapers, rollers, dumpers,  
shovels, etc.)  
Weighing machines  
Photographic and optical goods  
Watches and clocks

7. Craft or precision hand work -

Carpet weaving  
Coir manufacture  
Glass hollow ware  
Glass laboratory ware  
Misc. glassware, including optical glass  
Mica factories  
Jewellery  
Bone, ivory, horn and similar articles  
Slates and slate pencils.

J A P A N

FOOD PRODUCTS

1. Less than 50 employees

Vegetable and fruit canning sauces  
Vinegar  
Rice polishing  
Potato processing  
Animal feed  
Soft drinks  
Crackers  
Pastry  
Noodles  
Winery  
Beer  
Sake  
Tea  
Ice

2. Less than 100 employees :

Meat packaging  
Dairy products  
Soy sauce  
Spirits  
Confectionery

TEXTILES

1. Less than 50 employees

Silk weaving  
Special textiles  
Cotton knit underwear  
Socks

Cotton gloves  
Yarn dyeing  
Handloom cloth dyeing  
Fibre for nets  
Waterproof cotton cloth  
Lace  
Cord  
Hairnets  
Fine cloth  
Felt

2. Less than 100 employees :

Woollen knitwear  
Carpet and mats  
Sanitary materials

APPAREL

1. Less than 50 employees :

Men's clothing  
Women's and children's clothing  
Working clothes  
Underwear  
Panama hats  
Cotton hats  
Furs  
Japanese clothing  
Neckties  
Scarfs  
Handkerchiefs

2. Less than 100 employees :

School uniforms

WOOD AND WOOD PRODUCTS

Less than 50 employees .

Saw milling  
Wooden buckets

FURNITURE AND FIXTURES

Less than 50 employees :

Furniture

PULP AND PAPER PRODUCTS

1. Less than 50 employees :

Paper products  
Household wrapping paper  
Paper boxes  
Fibre boxes  
Cellophane

2. Less than 100 employees :

Large paper bags  
Cardboard boxes

PRINTING AND PUBLISHING

Less than 50 employees :

Duplicating  
Book printing  
Book binding  
Printing goods  
Job printing  
Photo-offset

Typesetting  
Lithography  
Other printing services

CHEMICALS AND CHEMICAL PRODUCTS

1. Less than 50 employees :

Lanolin  
Cosmetics  
Candles  
Tanning oil  
Wax products  
Natural perfumes  
Grease  
Non-petroleum grease and oil waste oil  
Asphalt

2. Less than 100 employees :

Printing ink  
Glue  
Coal briquette

RUBBER GOODS

Less than 50 employees :

Reclaimed rubber  
Waste rubber  
Recapped tires

LEATHER AND LEATHER GOODS

1. Less than 50 employees :

Leather goods  
Leather bags  
Harnesses

2. Less than 100 employees :

Tanneries  
Industrial leather except gloves

STONE, CLAY AND GLASS PRODUCTS

1. Less than 50 employees .

Flat glass  
Optical glass  
Glass goods  
Stone goods  
Bricks  
Clay pipe  
Industrial ceramics  
Concrete products  
Artificial jewellery

2. Less than 100 employees :

Pharmaceutical glass  
Flasks  
Ornamental ceramics  
Asbestos

PRIMARY METALS

1. Less than 50 employees :

Re-rolled steel products  
Drawing steel bars and snapes  
Primary refineries (titanium, nickel)  
Secondary refineries (lead, zinc, aluminium)  
Non-ferrous foundries

2. Less than 100 employees :

Seamless steel pipes and tubes  
Primary refineries (copper)  
Rolling and drawing of lead

FABRICATED METAL PRODUCTS

1. Less than 50 employees :

Western cutlery  
Handtools  
Work tools  
Hand saws and blades  
Agricultural tools  
Stamped and pressed metal products  
Coating metal products  
Engraving on metal  
Nails  
Nuts and bolts  
Safes

2. Less than 100 employees :

Knives for machinery  
Cutlery and artisans tools  
Files  
Radiator pipes  
Construction and ornamental metal  
Galvanizing  
Steel springs  
Metal tubes

MACHINERY, EXCEPT ELECTRICAL

1. Less than 50 employees .

Special industrial machinery  
Food products machinery  
Printing and binding machinery

2. Less than 100 employees .

Construction machinery  
Metal-working machines except machine tools, metal machine  
tools and accessories  
Dyeing machinery  
Wood products machinery  
Pulp and paper machinery  
Pumps  
Refrigeration equipment  
Fire extinguishers

ELECTRICAL MACHINERY

Less than 100 employees .

Wiring devices and supplies

TRANSPORT EQUIPMENT

Less than 100 employees .

Bicycles  
Rickshaws and parts  
Wooden boat building and repair

INSTRUMENTS

1. Less than 50 employees .

Medical instruments and accessories  
Surgical and orthopedic appliances and supplies

Physical and chemical apparatus and instruments  
Optical glasses

2. Less than 100 employees :

Microscope

Telescope

Lenses for optical apparatus

MISCELLANEOUS

1. Less than 50 employees .

Sports goods

Buttons and ornaments

2 Less than 100 employees :

Jewellery musical instruments

Pens

Pencils

UNITED STATES

Less than 50 employees :

Meat packing  
Prepared meats  
Poultry dressing plants  
Creamery butter  
Natural cheese  
Bottled and canned soft drinks
