WEIGHTS AND MEASURES

Metric systems of weights and measures are

. used in Indonesia

1 . . . 1

•

SUHENPY

The small-scale food industries lack technical know-how, and follow only traditional methods. The products, thus, they manufacture are generally of low quality and have poor shelf-life.

The Government of Indonesia wished to provide technological support to the small-scale food industry to a) up-grade the quality of their products, b) improve their production methods, and c) help them in their effort of product diversification. The mechanism chosen to achieve these aims was to assist the Chemical Research Institute (CRI) - now named Institute of Research and Development for Agro-Based Industries (IRD-BI) of the Ministry of Industry, so that it could up-grade its expertise and facilities and, thus be able to provide the needed technological know-how and encourage the development of the food processing industry.

Under the auspices of the Froject, a multipurpose food Processing Laboratory (Figures V to VII), furnished with equipment (Appendix IV) has been established for IREAST staffmembers to develop new and/or improved food products. Sixteen new and/or improved food products have been developed and introduced to the food industry.

The institutional pairing link-up between IRDABI and the Tropical Products Institute, London (TFI) was strengthened. TFI arranged fellowship training for eight staffmembers of IRDABI, as well as conducted on-the-job training course in instrumental analysis and general food analysis at IRDABI for its staffmembers. Nine staffmembers (appendix ILT) received training abroad in food research and management, food processing methods, food analysis and quality control. Several in-house and out-reach courses (Appendix VII) in principles of food processing, manufacturing of food products, food analysis and quality control were conducted at IRUABI and in the field for the small-scale food industry entrepreneurs and employees, DIFIK extension service officials, school supervisors and IRDABI staffmembers.

An effective collaboration established between IRDABI and BIPIK assisted in conducting field surveys (Appendix V - 1, 6 to 8 & 10) in selected regions of west Java and East Java (Frontispiece). The problems faced by the small-scale food industry (Appendix V - 9) were identified, and solutions suggested. On the basis of the information gathered during the field surveys, and research and development work carried out in the Food Frocessing Laboratory, 31 instruction manuals for different food products (Appendix V - 20 to 50) have been prepared and distributed to the smallscale food industry, BIPIK extension service officials and others.

The objectives of the Froject have been achieved. IRDAEL now possesses modern facilities to develop new and/or improved food products, and have high-grade expertise to provide extension services and guidance to the smallscale food industry. The research and development as well as the extension service capabilities obtained are being utilized to provide continuous onthe-spot guidance to the small-scale food industry in Elitar/East Java and Fandeglang/west Java regions.

It is now imperative that IRDEBI should strengthen the extension service activities to disseminate the results of its research and development activities for utilization and, thus, help in the industrial advancement of the country.

The activities of the out-posted Teams should be expanded to other regions, and should also cover other products.

2. INTRODUCTION

3

2.1 BACKGROUND

Agriculture is the largest employer and sector of the Indonesian economy. About half of all agricultural workers are employed by agriculturerelated industries. Processed-foods-and-beverages industry is an important element in the country's industrial sector. Foods and food products contribute to the general well-being of the people.

The HEPELITA III (The Third Five-Year Development Plan), which was launched by the Government in 1979, stipulates that special attention should be given to the promotion of the small-scale industries. The development of the small-scale food industry attains ever more significance as this group is about the second largest 1/ in the small-scale industries sector.

Indonesia also has a large variety of fruits and vegetables, but their processing has still not been or was just superficially explored. The potential of the country for exporting processed foods is considerable.

The majority of the small-scale food industries are family-owned and family-run enterprises. They lack technical know-how, and follow only traditional methods to produce their products. The products, thus, they manufacture are generally of low quality and have poor shelf-life. It is the Government's policy, incorporated in its development plan, that food

1/ Government of Indonesia. Surveys of Small-Scale Industry, January - April 1974.

processing as practiced today should be urgently up-graded, and more rational methods of production encouraged.

In order to improve the technological capabilities of the country's small-scale industries and the quality of their products, the Government is planning and already implementing a number of programmes. Through this Project, the Government wished to provide technological support to the food processing industry, particularly the small-scale food industry to

a) up-grade the quality of their products,

b) improve their production methods, and

c) help them in their efforts of product diversification in consensus with BIPIK (Guidance and Development of Small-Scale Industry).

The Chemical Research Institute in Bogor (CRI) - now named Institute of Research and Development for Agro-Based Industries (IRDABI), of the Ministry of Industry was responsible for providing some technical services to the agriculture-related industries. Its main function was testing of essential cils and product certification. However, it lacked in the capability of food analysis, quality control and new product development. It was decided to assist IRDABI through this Project, so that it could improve its expertise and facilities and be able to provide the needed technological know-how to encourage the development of the food processing industry.

2.2 OFFICIAL ARRANGEMENTS

The Project was initiated sometime in 1975 when a Project Document was drafted on the basis of studies and discussions by United Nations

Industrial Development Organization (UNIDO) personnel. Due, however, to delay in financing, etc., it was decided to expedite implementation by instituting Preparatory Assistance. The Project Document was refined, and some equipment was provided to IRDABI during the Preparatory Assistance phase.

The Government of Indonesia and the United Nations Development Programme (UNDF) signed the Project Document in May 1979, designating UNIDC as the executing agency and the Ministry of Industry (through CEI - now IRDABI) as the Government implementing agency. The Project Document specified a period of three years for the Project. This period was extended by 8.5 months at the Tripartite Review held on 27 November 1981. The Project was started on 16 April 1979 and will be completed on 31 December 1982.

The Project Document provided for \$542,136 UNDP contribution (including that provided during the Preparatory Assistance phase) for . experts, equipment, fellowship training, etc. This contribution was raised to \$692,180 to meet additional costs because of inflation and to cover the expenses for the extension period. The Government agreed to provide Ep.259,291,000 (in kind) comprising of counterparts, typist and driver, office and laboratory space and facilities; operating funds for operation and maintenance of equipment, and purchase of expendable equipment and supplies.

2.3 OBJECTIVES OF THE PROJECT

2.3.; Development Objectives

The development objectives of the Project were:

- to improve the quality of processed food products in Indonesia and, as a result, the efficiency of the food processing industries in the small-scale sector,

- to accelerate processed food products diversification through the utilization of as yet not utilized indigenous agricultural raw materials.

2.3.2 Immediate Objectives

The immediate objectives of the Project were:

- strengthen and up-grade the analytical and testing capabilities of IRDABI for food stuffs in general and processed foods in particular with an exclusive problem identification focus on the small-scale and rural industry,

- establish and bring into operation a laboratory scale, multipurpose food processing capability at the Institute for developing processed food products from indigenous, including those as yet unutilized agricultural raw materials, especially for the benefit of the small-scale food industry, and

- strengthen IRDABI's capabilities for providing technical information and product quality improvement services to the small-scale food processing industry in conjunction with the small-scale industry extension services instituted by the Government, particularly those through BIPIK.

The objectives of the Project have been achieved. IRDABI now possesses modern facilities to develop new and/or improved food products, and have high-grade expertise to provide extension services and guidance to the small-scale food industry. The research and development as well as

the extension service capabilities obtained are being utilized to provide continuous on-the-spot guidance to the small-scale food industry in Elitar/East Java and randeglang/mest Java regions. One of the fellows obtained a Master of Science degree in Food Research & Management. She is the Head of Institute for Development of Foods, Beverages and Phytochemical Industries; and would provide continued leadership for activities instituted under the Project, especially those for providing extension services and guidance to the small-scale food industry.

2.4 EEFORTS

This Terminal Report includes only the most essential features of the accomplishments and cross reference is made to the detailed information contained in the 50 supporting reports and publications (Appendix V) prepared during the life of the Project.

3. RESULTS AND CONCLUSIONS

3.1 INSTITUTE OF RESEARCH AND DEVELOPMENT FOR AGED-BASED INDUSTRIES

3.1.1 Organization and Responsibility

The Chemical Research Institute (CRI), of the Ministry of Industry was primarily responsible for providing some technical services to the agriculture-related industries. Its main function was testing of essential oils and product certification. However, in order to assist the country in its development effort and to meet the resultant requirements of industrial research and extension services for the agriculture-related industries CRI was, in May 1980, up-graded and named the Institute of Research and Development for Agro-Based Industries.

IRDABI comprises four institutes (Figure II), namely

- i) Research Institute for Foods, Beverages and Phytochemical Industries,
- ii) Research Institute for Chemurgy and Miscellaneous Industrias,
- iii) Institute for Development of Foods, Beverages and P al Industries, and
- iv) Institute for Development of Chemurgy and Miscellaneous Industries.

The supporting services include Division of Administration, Library and Workshop.

There are 193 persons working in IRDABI. The staffing pattern of IHUABI is shown on page 10.

The Project activities generally relate to those of the Institute

STAFFING PATTERN OF IRDABI

for Development of Foods, Beverages and Phytochemical Industries and also to those of the Research Institute for Foods, Beverages and Phytochemical Industries. The former institute has been designated as the counterpart institute for the Project.

3.1.2 Buildings

The main buildings of IRDABI are located in Bogor on Jalan Ir. H. Juanda. Most of the staff of the four institutes and the supporting services work there. Some of the staffmembers of the Institute for Development of Foods, Beverages and Phytochemical Industries are working at the Food Processing Laboratory in Cikaret/Bogor.

3.1.3 Food Processing Laboratory

No space was available at Jalan Ir. H. Juanda to put up a building and install the food processing machinery and equipment provided by UNIDO. However, IRDABI possessed a 5000 square meter lot adjacent to its Housing Complex in Cikaret, some three kilometers from IRDABI's main campus. IRDABI decided to construct the permanent building for the Food Processing Laboratory at that location (Figure V).

The construction of the building for the Food Processing Laboratory (Figure VI & VII) and installation of the ancillary facilities were completed in May 1981. The Project staff moved into the new premises in May 1981.

The equipment (Appendix IV) was installed and commissioned. A part of the equipment was installed by Metal Box Engineering of UK. Metal Box had contracted to supply the equipment, install it, commission it, and

also provide training, to the IRD.BI staffmembers, in operation and maintenance of that equipment.

3.1.4 National Staffing of the Project

The Director of IHDABI acted as the National Team Leader.

InDABI appointed 23 persons as national staffmembers (Appendix II) for varying periods during the life of the Project.

Most of the national staffmembers had the opportunity for varying periods to understudy the expert in their specialized fields. Nine senior national staffmembers received the orientation necessary for guiding their formal fellowship training.

Two national staffmembers are now working full-time on the two Outposted Teams, one stationed in Elitar/East Java and the other stationed in Fandeglang/west Java.

3.2 ACTIVITES

3.2.1 Statistical Lata

The technical extension service and guidance can be geared more profitably if one has adequate information available about the target group. Thus, as a preliminary step to conducting of the field surveys of the small-scale food industry, statistical data were collected on the type, number and location of such industry. The Provincial and District Industry Offices supplied the data shown in Tables 1 to 5 of appendix VI.

The production of coconut palm sugar is the largest sector of the small-scale food industry. Of the 24,090 units, 73% are located in rast

Java. Eliter region of East Java producers about 50 tons of coconut plan sugar per day. Later on, it was decided to station an Out-posted Team there to provide continuous on-the-spot extension service and guidance to the producers of coconut palm sugar (also see p.20).

The emping producing industry is another large sector of the smallscale food industry. Of the 11 708 units reported, 9% are located in West Java. Fandeglang region of West Java producers about 7 tons of emping per day. This region was also selected for the stationing of the Out-posted Team to provide continuous on-the-spot extension services and guidance to the emping producers (also see p.20).

The data proved useful in planning and conducting the field surveys of the small-scale food industry.

5.2.2 Setting for the Field Surveys

The agencies responsible for the development of small industry in Indonesia are a) the Directorate General of Small Industry and b) Agency for Industrial Research and Development, both constituent bodies of the Ministry of Industry (Figure III).

The Agency for Industrial Research and Development is responsible for the major institutes which are the sources of new knowledge, and technology generating centres in specific fields. Bimbingan dan Penyuluhan Industri Kecil (BIPIK) - Guidance and Development of Small Industry, in the Directorate General of Small Industry, is the major programme for the development of small industry in the country. It is funded by the national Government but implemented through the Provincial Industry Officers (KANWIL

Ligure 111. THE SCHEME OF ORGANIZATION OF MULLING OF INDUSTRY

4

F

PERINDUSTRIAN). In each of the Provincial Industry Offices, there is a BIPIK unit, as in the Central office (Figure IV). The activities of BIPIK normally include extension service, management and technical training, marketing assistance, raw material supply, quality control and standardization and surveys. BIPIK provides extension services and guidance to the small industry through its corps of 2,500 Tenaga Penyuluh Lapangan (TPL) -Extension Service Official.

3.2.3 IRDABI-BIPIK Collaboration

It will be seen from the foregoing that IRDABI has no field offices for the dissemination of results of its research and development, and provide technical extension service to the small-scale food industry. On the other hand, BIPIK has a wast net-work, spread through-out the country, to guide and assist the small industry, including of course the small-scale food industry. It was therefore imperative for IRDABI to establish a close collaboration with BIPIK. A relationship, such as shown below, was envisaged:

- Stage I The two-way link of BIPIK providing extension service and guidance to small food industry and the small food industry seeking help from BIPIK already exists.
- Stage II IFDABI-BIPIK collaboration would assist IEDABI to establish contact with the small-scale food industry to learn of their activities and the problems they faced, and then provide the requisite technical extension services and guidance to them through BIPIK. This cooperation would also ensure follow-up on the implementation of IEDABI recommendations.
- Stage III The IRDABI/Small-Scale Food Industry link-up would materialize, in due course, as IRDABI establishes its credibility and wins industry confidence by solving their problems of product quality and process improvement and in other ways.

An informal but effective collaboration was established early on with BIPIK. This proved very helpful in conducting the field surveys of the small-scale food industry. The BIPIK Provincial Offices arranged the meetings with the small-scale food industry, and also deputed its staffmembers to work on the Survey Teams.

3.2.4

Field Surveys

The Project teams, in collaboration with BIPIK officials, conducted four field Surveys (Appendix V - 1, 6 to 8 & 10). These teams covered 21 districts (Kabupaten) and municipal corporations (Kotamadya) in West Java and East Java. They visited more that 100 small-scale food industries engaged in producing different food products.

The teams collected information on production processes and

techniques, as well as on the problems encountered by the small-scale food industries. The problems faced by the small-scale food industry were identified (Appendix V = 9).

The various problems observed by the survey teams include improper quality of raw materials, out-moded production methods employed, insanitary conditions in the production area, poor packaging material and process used - all of which result in low quality of the food products produced.

The teams suggested on-the-spot improvements in processing methods and recommended products, and ways and means to improve the quality of their products. They were instructed and shown as to why a problem arose and how to solve it.

3.2.5 Instruction Manuals

The information obtained on the types of products, the methods employed and the problems encountered by the small-scale food industry and also the research and development work carried out in the Food Processing Laboratory helped in preparing 31 instruction manuals (Appendix V = 20 to 50) for different food products. These have been printed and distributed to the small-scale food industry entrepreneurs and employees, BIPIK extension service officials and others. These instruction manuals will be helpful to the small-scale food industry in producing food products of high quality, and more economically.

The instruction manuals have been prepared for the following food products produced in Indonesia:

| Abon | Minyak Kacang Tanah |
|---------------|---------------------|
| Bihun | Minyak Kelapa |
| Biji Mete | Oncom |
| Emping | Boti |
| Geren | Sagu Aren |
| Gula Aren | Sale Pisang |
| Hun Kwe | Sari Buah |
| Ikan Asin | Sirop |
| Kacang Asin | Sour |
| Keczp | Susu Segar |
| Kembang Gula | Tahu |
| Kembang Tahu | Tauco |
| Krupuk | Темре |
| Limm | Tengteng (Jipang) |
| Manisan Bush. | Terasi |
| Mie | |

3.2.6

Development of New and/or Improved Food Products

The Project staff has carried out research and development work on processing of indigenous agricultural raw materials to determine their suitability and potential for the production of food products. Sixteen new and/or improved food products have been developed and introduced to the food industry. The instruction manuals for the production of these food products are under preparation. These products are:

| Avocado | - | puree and frozen cubes |
|--------------|---|--|
| Banana | - | figs (candy) and flour |
| Cashew-apple | - | candy, chutney, jam, juice and wine |
| Mango | - | juice, squash, jam. chutney and pickle |
| Pine-apple | - | figs (candy) and jelly |

3.2.7 Out-posted Teams

During the Tripartite Review held on 27 November 1981, it was recognized that results obtained from the extensive field surveys and the development work carried out under the Project on improvements in smallscale food processing and application of improved process technologies had large prospects for raising the capabilities of the small-scale and rural food processing industries to a level where their products could be accepted in wider regional or national markets. Therefore, it was necessary to concentrate efforts on extension service activities in the surveyed regions during the Project extension period.

In order to effectively consolidate these activities and link the small food industry extension services to the activities of IRDABI, and to assist in the improved implementation of programmes planned by the Directorate General of Small Industry and the Regional BIPIKs, posting of full-time teams comprising staffmembers of IRDABI and National Experts for providing continuous on-the-spot extension services and guidance in selected regions in Java was considered necessary.

These contacts will inspire the staff workers to concentrate their efforts on solving relevant problems and encourage them to continuously strive for professional achievement in solving the problems faced by the small-scale food entrepreneurs.

Although the out-posted team concept for posting two teams at Elitar/ East Java and Pandeglang/West Java comprising locally hired UNDP-funded experts (National Experts) and IEDAEI's staff could not be fully implement-

ed due to difficulties in recruiting full-time experts, the INDABI staff under the supervision of the National Project Director and the UNIDO Project Sanager undertook this work. The detailed programmes of work (Appendix V -18 & 19) for the Out-posted Teams were prepared. Beginning June 1982, these Out-posted Teams started providing continuous on-the-spot extension services and guidance to the small-scale food industry, especially those manufacturing coconut palm sugar in Elitar/East Java region and those producing emping in the Fandeglang/west Java region.

The continuous on-the-spot technical extension service provided by the Out-posted Team has helped the coconut paim sugar industry to obtain better yields and produce superior quality product. They can now sell their product at a higher price, by as much as Rp.25 to Rp.50 more per kilogram than previously. Since some 50 tons of coconut palm sugar are produced daily in the Blitar region, it means that an additional daily income of hp.1.25 million to Rp.2.5 million is generated for the region.

Several pieces of equipment have been designed and prototypes produced for roasting & shelling the melinjo seeds, and for flattening the kernels to make emping.

3.2.8

Collaboration with Food Industry

A close collaboration was established between Ikunël and F.I. Unilever indonesia under which:

- eleven ImmaI staffmembers attended a 3-day training course in bakery products at the Food Freparation Laboratory of Unilever in Jakarta,

- Unilever agreed to produce several pieces of bakery machinery and equipment for admittion to the small-ocale producers of bakery products to assist them in improving their production between and the quality of their

products. IELAEI was requested to recommend the names of bakery entrepreneurs,

- Unilever offered to assist IEDABI in conducting training courses for the small-scale producers of bakery products as well as for the extension service officials of BIPIK and Provincial Industry Offices, and

- a technical manual on bread production - Fembuatan Hoti (Appendix V - 2) was prepared and distributed to the bakery industry.

3.2.9 Collaboration with PUSKOFTI and Regional BIPIKe

IRDABI is collaborating with Pusat Koperasi Produsen Tempe dan Tahu Indonesia (PUSKOPTI) - Central Co-operative of Indonesian Tempe and Tahu Producers, in their Rp.2.5 billion food processing plant, and with Regional BIPIK of Nogyakarta in the Perkampungan Industri Kecil project (PIK) -Working-cum-Residential Centre for Small Industry. The PUSKOPTI food processing plant would utilize tempe and tahu produced by the small-scale food processing entrepreneurs of PIK project. The food processing plant would manufacture processed food products wherein the major ingredients would be tempe and/or tahu, such as canned tempe, canned fried and salted tempe, tempe curry, canned tahu, canned fried tahu, canned tempe-tahu soup. IHDABI is assisting PIK project in producing tempe and tahu of better and standard quality to meet the requirements of the food processing plant. IEDABI is also providing consultancy services to PUSKOPTI in selecting machinery for their plant as well as in developing food products based on tempe and tahu that the PUSKOPTI plant would manufacture.

IRDAEI is also cooperating with Regional BIPHK of West Java in their

Lingkungan Industri Kecil project (LIK) - Working Centre for Small Industry. for improving the quality of tempe and tahu produced in the Bandung region. PUSKOPTI is planning to set up a food processing plant in Bandung. This food processing plant, like the one in Yogyakarta, would manufacture processed food products wherein the main ingredients would be tempe and/or tahu. The LIK project would produce the raw material, i.e., tempe and tahu, for this PUSKOPTI food processing plant.

3.2.10 UNIDO-TPI Contract TS1/OL

The UNIDO-TPI Contract T81/04 provided institutional back-stopping support to IRDABI in achieving Project objectives of strengthening and upgrading the analytical and development capabilities of IRDABI for food stuffs in general and processed food products in particular, and to enable IRDABI to provide technical information and product quality control services to the small-scale and rural food processing industry.

TPI provided fellowship training at its facilities in England to eight IEDABI staffmembers in fields of fats and oils processing, instrumental analysis, general food analysis, pesticide analysis, amino acid analysis and vitamin analysis.

Two training officers from TPI worked at IEDABI for four months. Besides assisting the TPI-trained staffmembers in setting up their shops, the training officers conducted a course, in instrumental analysis and general food analysis, for IRDABI staffmembers.

5.3 TRAINING AND EXTENSION

3.3.1

Fellowship Training

The fellowship training programme provided a greatly needed opportunity for IRDABL to up-grade its expertise in fields of food processing, food analysis and quality control. Wine staffmembers (Appendix III) completed training in food research and management, fats and oils processing, fruits and vegetables processing, instrumental analysis, general food analysis, pesticide analysis, amino acid analysis, and vitamin analysis.

One fellow obtained a Master of Science degree in Food Mesearch and Management from the Queen Elizabeth College, London. She is the Head of Institute for Mevelopment of Foods, Beverages and Phytochemical Industries; and would provide continued leadership for activities instituted under the Project, especially those for providing extension services and guidance to the small-scale food industry.

3.3.2 In-service Training

Host of the counterparts had the opportunity for varying periods to understudy the expert which provided for their in-service training at various levels in their respective areas of work. This training proceeded by several means: participation of the counterparts with the expert in field visits, surveys, and programming of work, participation in special training courses conducted by the expert, assignments for execution by the counterparts, and reading material and references brought to their attention by the expert.

Because of the new responsibility of research and development for agro-based industries the activities undertaken by IEDAEI had increased manyfold, and the need for personnel trained in principles of food processing had increased likewise. However, many of the IEDAEI staffmembers did not have any formal knowledge and experience of principles of food processing. It was, therefore, deemed desirable to afford an opportunity for IRDAEI staffmembers to participate in a training course in principles of food processing so that they could get acquainted with the language and terminology of the subject as well as recognize the relationship of the various disciplines to one another as applicable to solving problems of the food industry.

The course was designed and conducted to acquaint the IEDABI staffmembers with composition of foods, agents causing changes in foods and the factors influencing these changes, and finally the processing and handling techniques for preserving foods and preventing their spoilage. Material was included to provide information on relationship of food to nutrition and disease as they affect the general well-being of the individuals.

3.3.3 Non-staff Courses

Practical training was provided in courses and demonstrations (Appendix VII - 3 to 5, 16 & 17) for small-scale food industry entrepreneurs and employees, extension service officials of BIPIK, school supervisors and others.
3.3.4 Out-reach Courses

Many small-scale food industry entrepreneurs and employees have difficulty in finding time and funds to attend training courses at IMDABI. In order to provide for their training and assist them improve the quality of their products and the processes they use, IEDABI conducted several training courses (Appendix VII - 6, 8 & 9, 14 & 15, 19 to 21) in the field. These courses were attended by fish processors, producers of aren sugar, food and essential oil processors, tahu manufacturers, and copra producers.

3.3.5 Extension Services

Froject extension services consisted of technical assistance offered on an <u>ad hoc</u> basis during field visits or through consultations, advice in response to specific formal enquires, dissemination of the Project published reports, demonstrations, etc. Conditions necessitated that extension service be largely incidental. There is no official means by which extension services could be offered on a planned basis.

The activities of IEDAEI have increased tremendously, therefore, there is urgent need for IEDAEI to strengthen the extension service activities to disseminate the results of its research and development activities and, thus, help in the industrial advancement of the country.

3.3.0 Publications

The main medium adopted by the Project for disseminating its results of research and survey findings has been the issuance of separate publications, 50 to date (Appendix V. Lost of the publications prepared are

instruction manuals for the production of different food products produced in Indonesia. These instruction manuals have been specifically prepared to assist the small-scale food industry entrepreneurs and employees to help them in improving the quality of their products and the processes they use. These are also of assistance to the EIFIK extension service officials to enable them to provide the needed extension service and guidance on-thespot to the small-scale food industry in their respective regions.

4. RECOMMENDATIONS

The Institute of Mesearch and Development for Agro-Based Industries (formerly Chemical Mesearch Institute, is a widely recognized entity that has made a notable impact on the food industry, especially small-scale food industry.

The Institute has, through the Froject, up-graded its expertise and facilities. The staffmembers are adequately trained, equipment and facilities are excellent and sufficient to cater for most expansion in operations foreseen in the near future.

The Institute should strengthen the extension service activities, and continue the work of the Out-posted Teams, and the product development.

4.1

Extension Service Activities

with the tempo of industrial development of the country quickening, more and more food industry entrepreneurs, small as well as large, would need technical advice and guidance in setting up and/or up-grading their production facilities and also for improving the quality of their products. The Institute should, on its own, endeavour to disseminate the accumulating results of its research and development activities for utilization and, thus help in the industrial advancement of the country.

A system is needed for the dissemination of information, and for providing technical assistance and advisory services. The extension services should be formalized and staffed so that authentic responsible technical acvice can be rendered in collaboration with profissional sections.

Out-posted Teams

Many small food industry entrepreneurs and employees have difficulty in finding time and funds to attend formal training courses or they cannot afford to sacrifice earnings for this purpose. Therefore, the improvement in skill formation has generally to take place on-the-job.

The Institute is currently providing on-the-job technical assistance and guidance to the manufacturers of coconut palm sugar and emping in the Elitar region of East Java and the Pandeglang region of West Java, respectively. This assistance has started paying high dividends. These industries have been able to obtain higher yields and produce products of better quality. Their incomes have increased considerably. There is urgent need to expand this work to other regions and cover other products. Adequate funds should be provided to continue and expand this out-reach activity.

4.3

4.2

Product Development

The research work on the utilization of agricultural raw materials for developing new and/or improved products should continue. These new products should be introduced to the food industry. Instruction manuals for these products should be prepared and distributed to the food industry.

4.4

Follow-up

The Institute should, through EIFIE as well as on its own follow-up these activities and determine the benefits derived by the small-scale food industry. The association amongst small-scale food industry, EIFIE and the Institute should be actively persued.

Appendix I

UNITED NATIONS INDUSTRIAL DEVELOPMENT ORGANIZATION UNIDO

PROJECT IN THE REPUBLIC OF INDONESIA

28 November 1978

JOB DESCRIPTION DP/INS/76/001/11-01/31.3.A

POST TITLE Project Manager/Expert in Research and Development Food Processing

DURATION One year; with possibility of extension

DATE REQUIESD As soon as possible

DUTY STATION Bogor, Indonesia

DUTIES The expert will be assigned to the Chemical Research Institute (CRI) where he will work in close co-operation with the national staff and other local specialists and experts. He will assist in establishing and commencing operation of the processed food development laboratory and in initiating and assisting in the implementation of processed food development experimentation. Specifically, the expert will be expected to:

- 1. Assist in the planning and co-ordination of the Institute's activities in his field of specialization,
- 2. Assist and take active part in providing technical consultancy services to food processing industries in order to improve their operations and the quality of their products, with emphasis on (a) food processing hygiene; (b) improvement of specific unit operations; (c) quality control of raw materials and finished products,

- 3. Assist and take active part in the organization and carrying out of laboratory experimentations at the Institute laboratory aimed at directly assisting industry and supporting consultancy services activities,
- 4. Assist and take active part in introducing modern quality control systems and techniques in the food processing industries,
- 5. Co-operate with and provide advice to other experts carrying out market and feasibility studies in the fields of processed foods and food processing industries,
- 6. Assist and take active part in the preparation of training programmes for and in the training of local staff in the above fields, and
- 7. The expert will also be expected to prepare a final report, setting out the findings of his mission and his recommendations to the Government on further action which might be taken.
- QUALIFICATIONS University degree in food chemistry or technology, with extensive (i.e., fish, vegetables and fruit) processed food manufacturing, research and development, and quality control experience.

LANGUACE English

BACKGROUND INFORMATION The project was initiated some time in 1975 when a Project Document was drafted on the basis of studies and discussions by UNIDO personnel. The overall, immediate objective of the project is to strengthen the activities and capabilities of the Chemical Research Institute (CRI) in Bogor in the field of processed food evaluation and development so that it can provide improved services and on a broader scope as at the present time, to the smallscale food processing industries and the Government. The Government decided that the Institute under the Directorate General of Miscellaneous Industries, will play a leading role in the development. Due however, to the delay in financing, etc., it was decided to expedite implementation by instituting Preparatory Assistance, which was implemented during 1978.

The CRI has a wast experience, primarily in the testing of essential oils. To implement the Government's decision to strengthen CRI's capability of providing technical information and product quality improvement services to food processing industry, UNDP/UNIDO assistance wi'l be provided. During this assistance among others, attention will be paid to the developments of processed products from local agricultural commodities as yet unused for further development/growth of the small-scale industry.
