UNIT VALUE AND VOLUME
FOREIGN TRADE INDICES
FOR
VARIOUS INDUSTRIAL SECTORS

Prepared by
Edward F. Lucas

in co-operation with
Sectoral Studies Branch
Division for Industrial Studies

1339

This report consists of various unit value and volume external trade indices for seven industrial sectors ^{1/} for the years 1965 to 1982 based on available data from the UNSO trade tapes. Most of the indices are of exports from the main exporting countries, although agricultural machinery also includes indices for main importers and Latin American exports. Each index also contains a set of experimental supporting statistics which will eventually (hopefully) greatly expand the power of indexing technique, measuring the quality of an index as well as normally undecernable economic movements within the data.

Indices were computed for each annual interval according to the Paasche, Laspeyres and Fisher formulae and then chain-linked (or multiplied) to produce the multiple indices reproduced below. In the following tables, QPCH, QLAS, and QFSH refer to the Paasch, Laspeyres and Fisher quantity indices, and PPCH, PLAS, PFSH to the respective price indices. These indices were computed from all available data, but because of non-reporting of quantities by many countries the coverage is typically incomplete. As coverage changes from year to year this produces a bias in the quantity indices which was adjusted for following standard practice. The statistic NCOM refers to the number of reported values available in that year, and QCOMB is the number of commodities with quantity data in both years of each interval. The coverages, COVB and COVC, refer to the percentage of the value in the base and current years which have quantity data. The descriptive categories GEO SUB and COM SUB obviously define the trade flows which have been indexed.

All of the parameters involved in the computation of an index are fully documented in the control card listing preceeding each set of indices. Most data is indexed at the four-digit SITC level, but the level is indicated by "/3" or "/4" where there is some ambiguity. All of the unitvalue indices are in SDR's as indicated, which is analytically superior, but the result can easily be converted to US dollars if divided by the conversion time series listed in the control card "C/\$=".

Each index has a set of supporting statistics which were discussed and referenced in my previous paper, "Measuring International Trade Flows", and I will therefore not repeat that discussion. In definitional terms, DRFT is the annual Paasche-Laspeyres drift, defined as Paasche/Laspeyres - 1 for purposes of sign. CQFSH and CPFSH are the geometric averages of the base and current-weighted coefficients of variation of quantity and price relatives, and RFSH is the geometric average of the weighted correlation coefficients (maintaining the proper sign). These last three multiply to the drift, and I have argued that they are measures of composition change, relative price change and market structure respectively. C(QFSH) and C(PFSH) are the geometric averages of the base and current weighted coefficients of variation of the maximum annual sampling error, and are functions fo both data variability and sample size. T(QFSH) and T(PFSH) are the cumulative versions of this maximum sampling error.

^{1/} capital goods, pharmaceuticals, agricultural machinery, vegetable oils, lime and cement, fertilizer and iron and steel
