## INVESTMENT PROJECT REPORT

Development plan of the Cameroon Shipyard and Industrial Engineering Company  
(CNIC)

Number : DU/RAF/89/850

(Manufacture of Equipment for Land Rail and Water Transport)

### **FOREWORD AND THANKS**

This study was conducted by a TRACTEBEL Consult team, designated after a restricted call for tender.

The present report is the draft of the final report; it was established after several two-week missions in Africa (Cameroon, Benin and the Ivory Coast), 2 months of desk works in home office and a synthesis meeting in Headquarters of UNIDO together with CNIC General Manager and the chairman of the CNIC Board.

The Project Manager and the team members on this project are :

- Project Manager : Mr Yves Ekoué AMAIZO, Feasibility Studies Department, Industrial Development Division;
- Team Leader, Economist and Financial Analyst : Mr Bruno LAMBIN, Manager of TRACTEBEL Consult;
- Expert on Naval Construction and Repair : Mr Jean Marchal, Professor at the University of Liege, manager of the Naval Transport Systems and Construction Department; associated to TRACTEBEL Consult;
- Mr Byll ARHINI, industrial economist of ACA consulting firm.

This study was conducted by UNIDO experts and has benefited from the information, advice and support of the following bodies and organisations :

- Ministry of Industry,
- Société Nationale des Investissements,
- UNIDO representation at Yaounde,

- Belgian Embassy at Yaounde,
- Offshore Projects companies,
- Carena Naval Shipyard (Abidjan),
- United Nations (FAO) at Cotonou,
- Executives and Staff of CNIC.

We wish to thank all of these for their support.

## SUMMARY

### PRE-FEASIBILITY STUDY FOR THE DEVELOPMENT OF A REGIONAL UNIT FOR TRANSPORT EQUIPMENT IN CAMEROON (CNIC)

Chantier Naval et Industriel du Cameroun (CNIC) is a naval repair and maintenance enterprise created in 1988, employing some 150 personnel, having its installations and head offices in the port area of the town of Douala.

CNIC is equipped mainly with three floating docks, one of which has 10 000 t lifting capacity, purchased in 1988 and owned by the Cameroon Government. The other floating docks are owned by the National Ports Authority.

The CNIC shareholder ship is structured as follows :

- Cameroon National Ports Authority (ONPC) : 20 %
- Other Cameroon State Organisations : 50 %
- Private European enterprises : 30 %.

It is important to bear in mind that, on account of the disappearance of the present partners, the 30 % held by the foreign shareholders are available and could be repurchased (and subscribed to) by other candidate partners.

One of the major problems facing the development of CNIC's activities resides in the (provisional) present location of its main floating dock (10 000 t), which is berthed at a distance of 3 km from the CNIC workshops, rendering difficult its utilisation, increasing the construction, repair and gracing work completion times. This situation makes CNIC less competitive compared to its main competitors (Carena at Abidjan, and South African shipyards).

In 1993, CNIC's turnover was about FCFA 1200 million, of which more than 800 million were accounted for by interventions on about thirty ships.

Since 1990, the gross results and net profits of CNIC are both positive (respectively millions : 321 and 62 in 1992).

However, it must be stressed that CNIC bears no financial charges bound to the acquisition of its main production resources; similarly, neither has CNIC to bear the amortisation of its equipment. Therefore, the profits booked are to a degree artificial, especially that the equipment it rents from ONPC is billed at rates reflecting quite less than its actual value. In other words, CNIC is significantly subsidised by the Cameroon State.

The study analyses the project as a whole in that it considers all the assets used.

The market research reveals that along the more than 6 000 km stretch of coastline between Abidjan and Capetown, there are only very few reliable shipyards capable of providing maintenance and repair services for vessels in excess of 2 000 t.

In this area, and particularly in the Gulf of Guinea, substantial offshore oil activity is developing. For the fleet active in the Gulf of Guinea and, of course, for the Cameroon vessels, Douala is the nearest place where ship repair services can be provided.

Carena, the main competitor in this field, is a French firm which works at full capacity and is competitive enough to attract business from a substantial part of the fleet in the Gulf of Guinea, despite its being located at a distance from that area.

The CNIC shipyard proximity is an undeniable asset, since vessels are able to curb their travel times and, hence, their fuel bills.

It can be said confidently that, with respect to ship maintenance and repair, there exists in Cameroon an attractive potential market for a local competitive shipyard.

However, as for ship construction, there is practically no market, neither in Cameroon nor in the sub-region. Fishing vessels are for the major part bought second hand (steel hulls).

The project consists of :

- reinforce the local technical expertise by means of an operational program of training
- re-siting the 10 000 t floating dock to its final location, this being expected to yield gains in productivity of between 20 to 30 %

- purchasing of additional machines and tools permitting to meet any demand for repair and maintenance services
- identifying an experienced technical partner who would take a significant share in the capital and who would supply technical cooperation.

## **CONCLUSIONS**

CNIC, which is still in its starting phase, has adequate production resources, especially the 10 000 t floating dock, still provisionally berthed in the port area of Douala at a distance of 3 km from its workshops.

The projected investment regarding additional tools, and, especially, for the rational siting of the docks (implying the relocation of the 10 000 t dock), as well as for effective technical cooperation, should enable CNIC to offer to its potential clients, who are many in this sub-region, more competitive services in terms of completion times, quality of work and improved range of services.

These technical and human resources would make for improved productivity and a higher utilisation ratio of the CNIC installations.

Under these conditions, a doubling of the turnover can be expected within 5 years so as to reach 6 billion in the year 2010 (i.e. roughly the same level of business as Carena at Abidjan).

Computed over 15 years, the Internal Return Ratio amounts 12.8 % (of the total investment), which is satisfactory considering the size of the investment, i.e. the totality of the assets available to CNIC (i.e. including those owned by ONPC and the Cameroon State).

This project perfectly fits within the objectives assigned to the study, these being the production of services for maritime transport, since the development of the repair and maintenance services by the CNIC river units will make it possible for the country to :

- on the one hand, avoid expenditure and costs (in foreign currencies) for the journeys of the vessels that would have to travel longer distances for repair and gracing at facilities far distant from Douala (without implementation of the present project), and,

- on the other hand, sell maintenance and repair services (billed in foreign currencies) to many vessels of the oil sector operating in the Gulf of Guinea, which at present (without the project) are travelling for these services to the Ivory Coast or South Africa.

The success of this project will allow the technical capacities reinforcement of the Sub-Region in the field of ship repair and industrial engineering.

The objective is to present to the Sub-Region and international ship owners, high-performance services, namely :

- short completion times
- quality of work
- improved range of services
- competitive price

**INVESTMENT PROJECT REPORT**

## **1. PRESENTATION OF THE ENTERPRISE AND ITS SHAREHOLDER SHIP**

Chantier Naval et Industriel du Cameroun (CNIC) is a shipyard and industrial engineering company created in 1988; its installations and its operational head offices are located in the Douala port area.

The company employs some 150 personnel (temporary personnel included).

The technical resources available at present to CNIC are :

- 1 floating dock, 10 000 t (dated 1987, purchased 1988) and owned by the Cameroon State,
- 1 floating dock, 1 000 t (dated 1904, without lifting equipment, though still operational) owned by ONPC (National Ports Authority),
- 1 floating dock, 500 t, dated 1982, with lifting equipment owned by ONPC,
- 400 m<sup>2</sup> surface area of covered workshops (boiler making, general mechanical workshop, joinery, stores),
- berthing facilities, offices and 13 hectares of land.

Annex 1 gives a copy of the presentation brochure of CNIC's activities.

CNIC owns only the tools, machines, office furniture and vehicles; all the other equipment and resources (docks, crane, quays and buildings are owned by the State and rented to CNIC on a 25 year lease, for a rental fee for the equipment and the occupation of a portion of the public domain of the port of Douala. This fee is set at 25 million/year.

The company capital amounts to FCFA 800 million, 70 % of which is held by the Cameroon parties as follows :

- Office National des Ports Camerounais (ONPC) : 20 %
- Société Nationale d'Investissement (SNI) : 15 %
- Société Nationale d'Hydrocarbures (SNH) : 15 %
- Cameroun Shipping line (CSL) : 10 %
- Cie Nationale des Chargeurs du Cameroun : 10 %

and 30 % by the European parties :

- A & P Appledore (UK) : 10 %
- Dapico (Denmark) : 15 %
- Naval Invest (Switzerland) : 5 %.

One of the major problems facing the development of CNIC's activities resides in the (provisional) present location of its main floating dock (10 000 t), which is berthed at a distance of 3 km from the CNIC workshops, rendering difficult its utilisation and increasing the repair and graving work completion times. This situation makes CNIC less competitive compared to its main competitors (Carena at Abidjan, and South African shipyards).

## **2. EVALUATION OF THE EXISTING SITUATION**

### **2.1. Situation of available assets**

At June 30, 1992 (the last balance sheet available), CNIC's own capital still represented some FCFA 600 million (i.e. 50 % of the liabilities) despite the losses carried over from the first two business years; the paid up company capital amounted to 708 million and the capital called is 800 million.

Tables 1, 2 and 3 present the balance sheet as at June 30, 1992, as well as the situation of the shareholders' account.

To Cameroon, the purposes of having these European partners were two : getting access to international clients, with payment of a commission to these partners for business so obtained, and getting access to European technical assistance. The latter expectation has not yet been met.

It is now important to stress that, given the little interest displayed by the present partners, 30 % (or even more) could be taken over by other candidate partners. Annex 2 gives a list of Belgian firms in this sector which may be contacted with a view to examining with them whether they would be interested in taking a share in the capital (to this day, no contacts have been made nor information in this respect supplied to these firms).

The immobilised assets owned directly by CNIC are estimated (at June 93) to amount to 273 million (cf. tables 4 and 5).

In turn, the assets made available to CNIC by their owner, the Cameroon State, amount to close to 6 700 million, and are composed mainly of the floating docks and the workshop (cf. table 6).

Accordingly, the assets available to CNIC which it needs to operate as a ship repairer and graver are estimated to be close to 7 billion, of which only 4 % are actually owned by CNIC.

## 2.2. Evolution of CNIC's activities

Table 7 gives the evolution of CNIC's operation accounts of the last four years.

CNIC's turnover evolved as follows :

- 435 million in 1989,
- 617 million in 1990,
- 1167 million in 1991,
- 1604 million in 1990
- 1200 million in 1993, of which more than 800 million consist of work on some 30 vessels.

Also, in 1992, the company carried out an exceptionally large job on the Youpwe dredge of ONPC, which in itself accounted for 520 million of that year's turnover.

Since 1990, the gross results and net profits of CNIC are both positive.

However, it must be stressed that CNIC bears no financial charges since it is not the owner of its main production resources and therefore has not had to finance these.

Similarly, neither has CNIC to bear the amortisation of its equipment. Therefore, the profits booked are to a degree artificial, especially that the equipment it rents from ONPC is billed at a rental fee reflecting much less than its actual value.

In other words, CNIC is significantly subsidised by the Cameroon State.

The study analyses the project as a whole in that it considers the totality of the assets used.

It is also worthwhile to mention that CNIC has been granted the D status of the Investment Code, giving it various advantages (exoneration from taxes, patent rights, customs taxes and duties on imports, etc.).

### **3. MARKET ANALYSIS**

This point provides a description of ship repair and construction supply and demand in the area of the gulf of Guinea.

#### **3.1. Existing supply of ship repair**

Along the more than 6 000 km stretch of coastline between Abidjan and Capetown, there are only very few reliable shipyards capable of providing maintenance and repair services for ships in excess of 2 000 t.

In this sector and particularly in the Gulf of Guinea, substantial offshore oil activity is developing. For the fleet active in the Gulf of Guinea and, of course, for the Cameroon vessels, Douala is the nearest place where ship repair services can be provided. The nearest competition are located at Abidjan (Carena) and at Capetown. For a supply boat, the journey to Abidjan, for instance, already means 6 days at sea.

The other competitor shipyards, less busy (or more distant, or maybe less reliable) are situated in Cape Verde, at Dakar, in Ghana (Thema), at Lagos and in Namibia.

At Douala itself, there is also a workshop belonging to Bouygues which carries out ship and mechanical repairs (engines, electrical repair and steel plate working); however, this facility, the Union des Industries du Cameroun (UIC), has no lifting equipment.

### 3.2. Carena shipyard at Abidjan

In the course of the data collection assignment, a visit was made to the Carena shipyard at Abidjan, a French firm set up under Ivory Coast Law.

This shipyard had a turnover of FCFA 5123 million (in 1992) and works at capacity with the following facilities :

- a floating dock with 600 t lifting capacity (4.40 m draught),
- a 200 t floating dock (5.20 m draught) with a 3 t crane,
- a 10 000 t floating dock (6 m draught).

The firm at present has three spillways with up to 300 t lifting capacity; it employs 337 people, among whom 23 non-African expatriate staff.

The order book is usually filled for 3 to 4 months, despite the high prices charged for repairs (European prices or even higher).

The yard's activity concerns mainly ship repair for the oil sector (60 %); ship construction represents only 4 % of the turnover.

In the 92/93 business year, Carena repaired or provided maintenance work for some 203 vessels.

The cost structure roughly consists of

- |                              |      |
|------------------------------|------|
| - labour :                   | 70 % |
| - materials and consumable : | 30 % |

Carena's strategy focuses on the development of the means towards meeting the clients' criteria of speed of the work and an extensive range of services so that the time of unavailability of the vessels can be kept to the minimum.

The proximity of a shipyard is an undeniable asset : it makes it possible to reduce the sailing time and thus also the fuel cost for the journey to the shipyard.

### 3.3. Ship construction

The ship construction market is a very small one in the sub-region, and there is practically no export of new constructions since most of the materials and components are imported, so that ship builders are hardly if at all competitive.

Purchases of fishing vessels are mostly for second hand boats (with steel hulls).

As regards construction of wooden boats, the problem arises, at least in the west of the Region, of timber supplies, including in the Ivory Coast, where very little quality timber is available.

The only activity left with respect to wooden boats concerns the small scale crafting of canoes for inshore fishing.

The Cameroon fishing industry uses some forty trawlers, most of these imported since, as mentioned before, there is hardly any local construction of boats with steel hulls.

Fishing industry is falling, and to meet the demand for fish, a considerable rise is taking place in frozen fish imports, this in turn calling for the development of the "low temperatures" industry.

### 3.4. Demand for ship repair and maintenance

More than 360 supply boats are in operation in the Gulf of Guinea, 7 of which operated by Cameroon companies. Maintenance to these boats is required on average every 18 months.

Cam ship (CSL) owns two boats and charters more than 6 other boats.

ONPC has about a dozen of service boats that need gracing on average twice a year.

The Cameroon navy has 3 vessels.

About a 1000 cargo vessels call at Douala every year, and on average stay in port for some 3 three days. Accordingly, they are potential users of CNIC services for repair work afloat or in the dry dock.

As said before, the fishing sector comprises some 40 trawlers, which can use the 550 t and 1000 t docks.

Therefore, the demand is very high, and a highly attractive potential market exists for a competitive shipyard.

#### **4. PRODUCTION MATERIALS AND FACTORS**

The raw materials of CNIC are mainly steel plate, bends, sections, tubes and pipe, wood and semi manufactured products.

The production consumables comprise essentially paints and solvents, welding rods and materials, fuels and lubricants, gas and butane and electricity.

Practically all these materials are imported, on account of the local market having become too costly.

Purchases are usually made following invitations of tenders via a central procurement unit located in The Netherlands (ESMA); this unit is specialised in shipyard supplies.

Paints and solvents are purchased in two ways :

- either, via the ship owners who supply their own paint, or
- via a call for tender from international paint suppliers; the products are left by these on consignment and are billed by the supplier as and when they are being consumed.

#### **5. LOCATION AND ENVIRONMENT**

We must bear in mind that the main problem faced by CNIC is the present provisional location of its 10 000 t floating dock, which is berthed at one of the quays of the port of Douala.

This situation results in the major drawbacks of remoteness (3 km) of the dock from the CNIC workshops (affecting its productivity) and the unavailability of a berth at the quay in the Port of Douala.

The new location considered at present offers the following advantages :

- it is close to the existing workshops (mechanical and steel plate working),
- easy access by the road, close to the town,
- railway sidings, useful in the event of various industrial work involving steel plate (wagons, containers, etc.).

The transfer of the 10 000 t floating dock to this location, together with the arrangements to the area where finally the three docks will be grouped side by side (the 500 and 1000 t docks are already situated at this place) will require various work; this work is already programmed in the 5th Plan for the Transport Sector, in which an amount of 4 billion has been allocated to it.

Of this amount, the portion dedicated specifically to the installation of the docks amounts to 1.7 billion.

The dock installation work involves :

- a package of marine and infrastructure construction (site installations, protective fenders, quays, access jetties to the docks),
- a package of dredging work (dredging and embankment protection),
- a package of road and drainage work.

This work was the subject of a contract (No. 2389/AO/85-86 dated 26 May 1986), which started financed from the State's own resources; the work was stopped in May 1987 after about 30 % had been completed.

Now that 6 years have past, the project should be re-evaluated and a technical study conducted so as to re-assess the investment cost of this installation work.

Since the site is in the port area, the dredging (to 5 m depth with respect to the 0 hydrographic reference level) is carried out by the Port services. Considering the 2.5 m amplitude of the tide, this dredging would result in 7 m depth, enough to secure access for 10 000 t vessels.

The feasibility of these arrangements, as well as of the access and the silting up rates, if any, need to be checked prior to performing the basic design work.

## **6. TECHNICAL ASPECTS**

### **6.1. Present situation of CNIC**

As indicated previously, CNIC has lifting equipment available which is owned by ONPC and leased by the latter to CNIC.

This equipment comprises :

- 1 floating dock with 500 t lifting capacity (42 m long, 13.5 useful width), built 1982,
- 1 floating dock, 1000 t (60 m long, 13.5 m useful width), built 1903,
- one floating dock, 10 000 t (180 m long and 33 m useful width), built 1987,
- one floating crane with 120 t lifting capacity (very old, but operational),
- 4000 m2 of covered workshops, including :
  - a general mechanical workshop,
  - a steel plate working facility,
  - a joinery,
  - a warehouse for storage of components and materials.

The tooling and machinery is generally in good condition and is usually between 15 and 15 years old.

### **6.2. Development project**

It is estimated that the CNIC development plan could be achieved in two phases :

- a 1st phase in which the utilisation of the existing equipment could be optimised and its productivity improved,
- a 2nd phase in which the production capacity would be increased and also ship construction activity could be started.

In the present project, that second phase has not been taken into account as it is felt that, on account of the very low demand for ship construction, it would not be reasonable to as yet plan for a ship construction activity. This sub-project could be reviewed within 5 to 6 years after the completion of the 1st phase regarding the optimisation of the existing ship repair capacity.

Accordingly, the project encompasses :

- installing the 10 000 t dock at its final location, leading to a productivity improvement of between 20 and 30 %
- purchasing the additional tooling and machinery so as to be able to meet any demand with respect to repair and maintenance.

The investment for these additional tools and equipment is estimated at over 700 million, and will also call for basic and detailed preliminary design work.

The overall investment planned (1st phase) is summarised in chapter 9 (cf. tables 8 and 9).

The overall cost of the new investments planned is estimated at FCFA 2.8 billion.

## **7. HUMAN RESOURCES AND ORGANISATION**

The permanent personnel of CNIC numbers 93 (in April 1993), of whom :

- 31 for the General Management and the Administrative and Financial Management,
- 62 for the Production Management.

The company employs also one expatriate (Asian) with a direct contract.

The Production management, in addition to the Technical Bureau comprises five units (electrical, mechanical and engines, fabrication and erection, steel plate working, gracing & docks).

Annexes 3 and 4 present the present organisational chart of CNIC, as well as the situation of its permanent personnel.

## **8. PROJECT IMPLEMENTATION CALENDAR**

The project retained and of which the financial aspect is analysed in detail in chapter 9 hereafter, consists of the implementation of the investments that will result in increasing the company's productivity.

Accordingly, the investments taken into account are :

- installation of the floating dock in a small bay situated adjacent to the CNIC workshops, this item of the project requiring, therefore :
  - . design work and construction supervision,
  - . maritime construction and infrastructure work,
  - . dredging and protection of the embankment,
  - . extension of administrative buildings,
  - . construction of roads, drainage system, utilities.
  
- acquisition of additional equipment and machine tools with a view to improving productivity and offering a better range of services to meet market demand.

It follows that the investments planned by CNIC with respect to ship construction are not taken into account, such as :

- a slipway for shipbuilding,
- a steel plate working facility for shipbuilding,
- a training centre (it is felt that, as training is indeed of utmost importance, it should best take place with adequate instructors "on the job site", so there would be no immediate need for a building dedicated to training).

In any case it is planned that the administrative building will be extended and modernised.

The development plan can be implemented over a period of 2.5 years, of which :

- 6 months for the detailed design work,
- one year for the maritime construction, dredging and dock relocation,
- 1 year for the roads and drainage and building modernisation.

## **9. FINANCIAL EVALUATION OF THE PROJECT**

The financial evaluation concerns the project as a whole, i.e. the ship repair activity conducted by CNIC.

Are therefore considered part of the project the totality of the assets used to exercise that activity, and thus, above all, the floating docks and the workshop building with the steel plate and general mechanical workshops, which at present are the property of ONPC.

Thus the financial evaluation is an overall one that regards the business plan of an organisation that bears the whole of the real costs of its activity.

At present, CNIC leases the floating docks at a cost which hardly at all reflects their real value (the rent is 25 million/year); it follows that CNIC is indirectly subsidised by the State, and there is no doubt that the State will have to modify the level of this rent especially if the State is to finance the continuation of the project.

Rather than making assumptions as to the level of the future rent, it appeared to us more realistic to consolidate all the costs and evaluate the project on the basis of "true prices".

### **9.1. Summary of investments**

The new investments for the project are estimated at 2.8 billion, of which :

- 50 % for maritime structures and dredging,
- 30 % for equipment and machine tools,
- 20 % for roads and drainage, buildings and design work.

The overall investment taken into account in the financial evaluation amounts to 9 800 million (including rounded off figures and contingencies); it concerns the totality of the assets and investments for the ship repair activity, i.e.

- 2.8 billion of new investments,
- 6.7 billion of ONPC assets (docks and workshops),
- 0.3 billion of CNIC assets.

### **9.2. Estimate of future turnover**

The implementation of the proposed investment plan (rational facilities and additional equipment) as well as the benefits from the transfer of technology from experienced technical assistance should make it possible for CNIC to better meet the demand and offer more competitive services.

Under these conditions it is estimated that the productivity can increase as soon as from the second year of the next millennium with 10 % per year and as soon as from the year 2006 with 15 % year, this leading to the productivity being doubled within a span of 10 years.

Similarly, using closer to capacity the existing floating docks can be achieved, i.e. between 60 and 80 % (instead of the present 20 to 40 %).

Under these circumstances, CNIC would be capable of performing typical services on about 115 vessels, i.e. about a fourfold of the present production (making it rank with the level of activity displayed by Carena at Abidjan with their floating docks).

This brings the turnover at 6 billion t the 10th year after project implementation : i.e. five times the present turnover.

Table 10 summarises the business plan of the project.

### **9.3. Estimate of future charges**

The operating expenses, composed of variable expenses and fixed charges, have been extrapolated over the period considered, in function of the investment plan and the intended organisational changes.

For instance, among the factors taken into account is the increase in pay-roll costs due to CNIC being joined by a technical partner (to be identified) who will bring his experience in the sector of ship repair and gracing.

The benefits from incorporating such a team within CNIC comprise :

- assistance to the implementation of the investment project ( relocation of the dock, arrangements to the installations of the shipyard and the workshops),
- training in productivity improvement techniques,
- sales and management support.

The advisory and support personnel intended are the following :

- 1 assistant to the present Director General
- 1 administrative and financial staff
- 1 business promoter/sales staff
- 1 experienced ship repair engineer (production)
- 1 engineer for the Design Office,
- 5 senior technical staff (electrical, mechanical-engines, steel plate working, erection, gracing & dock)

i.e. in all 10 people.

Under these conditions, CNIC can achieve a substantial gross margin; in terms of internal return ratio however, the overall return is only an average one (IRR of 12.8%) essentially due to the size of the investment considered, especially for the 10 000 t dock which is now assumed owned by the company itself. The financing of such investment may be costly, but, nevertheless, that gross margin will make it possible to cover both the amortisation and the financial charges.

#### **9.4. Financial structure**

Given the hypothesis made in the present analysis that CNIC would become the owner of the whole of the assets required to perform its activity, the company will have to both amortise and finance the entirety of the assets available.

It has been assumed that CNIC would self-finance 50 % of the value of the new investments to be made and of the repurchase from the State of Cameroon of the assets the latter made available to it (that total 9.6 billion), and that the balance would be borrowed under the following conditions :

- duration of the loan : 20 years
- period of grace : 5 years
- interest rate : 8 %
- commitment rate : 0.75 %

#### **10. CONCLUSIONS**

CNIC, which is still in its starting phase, has adequate production resources, especially the 10 000 t floating dock, at present provisionally berthed in the port area of Douala at a distance of 3 km from its workshops.

The projected investment regarding additional tools, and, especially, for the rational siting of the docks (implying the relocation of the 10 000 t dock), as well as for effective technical assistance, should enable CNIC to offer to its potential clients, who are many in this sub-region, more competitive services in terms of completion times, quality of work and improved range of services.

These technical and human resources would make for improved productivity and a higher utilisation ratio of the CNIC installations.

Under these conditions, a doubling of the turnover can be expected within 5 years so as to reach 6 billion in the year 2010 (i.e. roughly the same level of business as Carena at Abidjan).

Computed over 15 years, the Internal Return Ratio attains 12.8 %, which is satisfactory considering the size of the investment, the latter being the totality of the assets available to CNIC.

Therefore, this project offers an attractive opportunity for a foreign partner of the ship repair and shipbuilding sector, providing he is willing to invest in the company both financially and in terms of human resources.

In this respect, one of the conditions to success is the integration of a team of experts in this sector into the CNIC personnel.

A majority holding in the capital of the company is a favourable position towards having the necessary measures adopted to make it competitive on this market.

Let us bear in mind also that the company has been granted a privileged status.

Table hereafter summarises the main components of the project as well as the recommended action plan.

| Components   | Action Plan  |
|--|--|
| 1. Training programme (management, planning, technical training) | Search for financing   |
| 2. Re-siting the 10.000 t floating dock                          | Search for financing the technical and realisation studies   |
| 3. Purchasing of additional machines and stocks                  | Search for financing the technical and realisation studies   |
| 4. Identifying and experienced technical partner                 | <ul style="list-style-type: none"> <li>- giving in CNIC the assets of State and ONPC, at an attractive price</li> <li>- search for an experienced technical partner</li> </ul> |

(1) CNIC has a lease under which it operates and manages equipment (3 floating docks, 1 floating crane and a workshop pontoon) and is authorized to use a plot of land in the port property comprising workshops, stores, aprons, offices, quays, basin, roads and drainage systems.

These tangible assets, therefore, are not shown in the CNIC Balance Sheet. Instead they are included in that of the owner : ONPC.

These assets are rented from ONPC at present; the annual rent amounts to 25 million

# PRESENTATION GENERALE

DATE DE CREATION : 5 FEVRIER 1988 - FORME JURIDIQUE : SOCIETE ANONYME - CAPITAL SOCIAL : 800 000 000 FCFA - SIEGE SOCIAL : DOUALA- CAMEROUN

## OBJETS PRINCIPAUX :

- REPARATION ET CONSTRUCTION NAVALES - TRAVAUX INDUSTRIELS ON ET OFF-SHORE - REPARATION ET FABRICATION DE CONTENEURS

## ACTIONNAIRES :

- CAMEROUN : ONPC, SNH, SNI, CNCC, CAMSHIP. - EUROPE : DAPICO (DANEMARK) - A & P APPLIEDORE (ANGLETERRE). - NAVAL INVEST (SUISSE)

## LES EQUIPEMENTS

\*3 DOCKS FLOTTANTS  
- 500 T (42M LONG X 13,5M  
LARGEUR UTILE)  
- 1 000 T (60M LONG X 13,5M  
LARGEUR UTILE)  
- 10 000 T (180M LONG X 33 M  
LARGEUR UTILE)  
\*UNE GRUE FLOTTANTE DE 120  
TONNES DE CAPACITE DE LEVAGE.  
\*4 000M2 D'ATELIERS COUVERTS,  
EQUIPES DE MACHINES OUTILS  
MODERNES.

## LES OBJECTIFS

OFFRIR A NOTRE CLIENTELE DANS LES DELAIS:  
UN MEILLEUR RAPPORT QUALITE/PRIX, UNE TECHNOLOGIE DE POINTE DANS LES DOMAINES :  
DE NOUVELLES CONSTRUCTIONS ET REPARATIONS NAVALES, DES INDUSTRIES ON ET OFFSHORE.

## LE PERSONNEL

INTERNATIONAL, DIVERSIFIE ET  
COMPETENT DANS LES DOMAINES :  
- DES REPARATIONS ET CONSTRUCTIONS NAVALES,  
- DES TRAVAUX INDUSTRIELS ON ET OFFSHORE,  
POUR LA CLIENTELE SUIVANTE :  
OPERATEURS INTERNATIONAUX  
DES BARGES OFFSHORE, DES PLATES-FORMES, NAVIRES, SUPPLY, CHANTIERS, REMORQUEURS, CHALOUPES.

# GENERAL PRESENTATION

DATE OF CREATION : FEBRUARY 5th, 1988 - FORME OF COMPANY : P.L.C. - CAPITAL :  
800 000 000 FCFA - HEAD OFFICE : DOUALA- CAMEROON

## MAIN OBJECT :

- SHIP REPAIRS AND SHIPBUILDING - ONSHORE AND OFFSHORE INDUSTRIAL ENGINEERING  
ACTIVITIES - MAINTENANCE AND MANUFACTURE OF CONTAINER - GENERAL ENGINEERING

## SHAREHOLDERS :

- CAMEROON : ONPC, SNH, SNI, CNCC, CAMSHIP - EUROPE : DAPICO (DENMARK)  
- A & P APPLIEDORE (U.K). - NAVAL INVEST (SWITZERLAND)

## OUR FACILITIES

- 3 FLOATING DRY DOCKS OF FOLLOWING LIFTINGS  
CAPACITIES :

- 500 T (42M LONG X 13,5M CLEAR WIDTH)
- 1 000 T (60M LONG X 13,5M CLEAR WIDTH)
- 10 000 T (180M LONG X 33M CLEAR WIDTH)

\* A FLOATING CRANE OF LIFTING CAPACITY 120 T,

\* AN AREA OF 4 000M<sup>2</sup> OF COVERED WORK-  
SHOPS, EQUIPED WITH MODERN MACHINERY.

## OUR PURPOSE

TO OFFER OUR CUSTOMERS AT  
AGREED TIME :

- THE HIGHEST COST EFFECTIVE AND  
QUALITY WORK,

- LATEST TECHNOLOGY IN THE  
FOLLOWING FIELDS :

\* NEW BUILDINGS AND SHIP REPAIRS  
(CIVIL AND NAVY),

\* INDUSTRIAL WORKS ONSHORE AND  
OFFSHORE.

## OUR STAFF

INTERNATIONAL, DIVERSIFIED AND COMPETENT  
IN :

- (1) SHIPBUILDING AND NAVAL REPAIRS,
- (2) INDUSTRIAL WORKS ON AND OFFSHORE

FOR THE FOLLOWING CUSTOMERS :  
INTERNATIONAL OPERATORS OF OFFSHORE  
BARGES, MODU'S, PLATFORMS AND SUPPLY  
BOATS, FISHING CRAFTS, TUG BOATS, WORK/  
CREW BOATS, DREDGERS, CARGO BOATS,  
TANKERS, ETC...

## BAMUSSO 10.000 TLC FLOATING DOCK

### CAMEROON SHIPYARD AND INDUSTRIAL ENGINEERING LTD.

#### Principal Particulars

|  |           |
|--|-----------|
| Length over all                        | 180.000 m |
| Length over pontoon                    | 172.000 m |
| Overall breadth of steel structure     | 40.800 m  |
| Breadth between side walls             | 34.000 m  |
| Clear width between side platforms     | 33.000 m  |
| Breadth of side walls                  | 3.400 m   |
| Slope of pontoon decks                 | 0.200 m   |
| Depth of keel blocks                   | 1.500 m   |
| Freeboard of dock in lowered condition | 1.500 m   |
| Water depth over keel blocks           | 7.800 m   |
| Pontoon freeboard (dock centreline)    | 0.450 m   |
| Normal lifting capacity                | 10.000 T  |
| Max lifting capacity                   | 12.140 T  |

The dock is equipped with six pumps needing approx 60 minutes to lift a ship with a weight of 10 000 tons out of the water until emerging the pontoon deck.

#### HULL STRUCTURAL AND DOCK OPERATIONAL EQUIPMENT

##### FLOODING & EMPTYING SYSTEM

3 adjacent ballast via pipelines compartments out of a total of 18 are connected through remote controlled gate valves to one collector. One doublesuction centrifugal pump with a capacity of 3 200 m<sup>3</sup>/h is associated to each of the collectors.

##### Central Control

Command of the entire ballast system is effected from the control cabin by means of indicators showing the pressure level in the individual tank systems, the draught, the dock's deflection as well as the heel and trim positions.

### Talk-back System

Reciprocal intercommunication between all vital stations on the dock, such as switchgear, capstans etc. Radio telephony connection to the ship.

### Warping outfit

4 warping capstans having a pull of 8 tons each controlled locally or from the control cabin with a combined traction and countering of always two capstans situated opposite to each other.

### Tanks

For accepting bunkers from drydocked ships four oil tanks holding a total of 680 m<sup>3</sup> and one pump room.

### Sanitary Systems

Integrated systems in the dock with sewage tanks and discharge line to the shore.

### Energy Supply

Electric energy is supplied to through a movable connecting cable in the form of 15 kv/50 Hz stepped down by dock own transformers to the operating voltage needed.

For the power supply to ships in drydock, there are available :

AC : 380/220 V - 50 Hz  
440 V - 60 Hz

### Keel & Bilge Blocks

109 keel blocks equispaced 1.25 m.  
24 beam style bilge blocks equispaced 7.5 m

### Facilities for Repair and New Construction Operations Dock Crane

Two dock cranes of 12.5 tons at 19 m radius and 6.3 tons at 22 m radius traversable over the full length of the dock.

### Pipe Lines

Dock-based pipe lines to be feed from ashore for

- Compressed air
- Steam
- Fresh water
- Fire fighting water

### Fire Fighting Equipment

Two fire pumps operating independrntly from each other capacity 120 m<sup>3</sup>/h WG.

### Construction Power Supply

380 V - 50 Hz three-phase AC

### Welding Power Supply

Welding rectifiers having a total capacity of 3 x 2500 A for 65 V welding current.
