Summary

Within the framework of the UNIDO assistance programme for the industrial valorization of the medicinal plants and their use in medicine in the least developed countries, UNIDO charged the Joint UNIDO/Romania Centre with the task of sending a mobile unit to certain African countries including Tanzania.

The main objectives of the mobile unit were to collect data about medicinal and aromatic plants, to carry out chemical determinations on active principles and to examine the prospects of processing them locally, in order to be used for the preparation of pharmaceuticals.

Six Romanian experts equipped with laboratory equipment, materials and two cars undertook a mission in Tanzania from 6 to 31 January 1980.

This was the second phase of the UNIDO programme which, in its first phase consisted of an exploratory mission which visited Tanzania in December 1977 under the project RP/RAF/77/015.

The activity of the mobile unit was carried out in the laboratory of the "Traditional Medicine Research Unit" under the coordination of the Muhimbili Medical Centre.

The experts prepared 15 pharmaceutical products, carried out 9 determinations of essential oils, 2 quantitative determinations of essential oils, 2 quantitative determinations of total alkaloids and 4 demonstrations on the identification of the active principles in herbs mixtures used in the traditional medicine.

The present report refers to the activity of the mobile unit, the findings and the recommendations of experts for the setting up of a small scale pharmaceutical industry based on

medicinal plants.

The recommendations on further UNIDO assistance refer to the training of the local personnel, international experts and equipment of active principles extraction and distillation pilot unit as well as complementary equipment for laboratory.

2. Introduction

The United Nations Industrial Development Organization (UNIDO) has a very important assistance programme for the development of a pharmaceutical industry based on the medicinal plants available in certain developing countries. Several programmes have been designed for different developing countries and some of them are already under implementation.

The utilization of medicinal plants has been always known in the developing countries and the largest part of the population make use of extracts or dry herbs for curing many tropical and epidemic diseases. Taking into account the increased demand for medicines in the world and in the developing countries too, a particular attention started to be focussed on the possibility of medicines production on a more economic basis such as the utilization of medicinal plants which many developing countries are rich in.

The Tanzanian flora is very rich in medicinal and aromatic plants and therefore it is advisable to process them in order to obtain the active principles and the essential oils useful in the pharmaceutical industry.

In this respect an exploratory mission visited Tanzania in December 1977 to collect information on the medicinal plants available in the spontaneous flora as well as the laboratory facilities necessary for the activity during the second phase -

the mobile unit.

After the exploratory mission the experts recommended to UNIDO to supply certain laboratory equipment, reactives and solvents for an amount of U.S.\$ 4500. These materials granted by UNIDO arrived in Tanzania during the mission.

The experts were received at the Ministry of Industry, which showed a particular interest to develop a pharmaceutical industry based on the natural resources and to improve the medical assistance of the people.

The representatives of the Ministry of Industry indicated as counter partners of UNIDO experts, the specialists of the Botanical Department of the University from Dar-es-Salaam and recommended the laboratory of the "Traditional Medicine Research Unit" - Muhimbili Medical Center to be the place where the laboratory activity could be implemented.

Both the "Botanical Department" of the University and the "Traditional Medicine Research Unit" have a herbarium whose collections are steadily increased by more samples of plants.

The laboratory of the "Research Unit" placed in the premises of the Faculty of Pharmacy is fitted with certain apparatus and glassware but not enough to develop the research activity in the future. The personnel of this laboratory is not sufficient (the director and senior research fellow, a chemist and a technician).

It is foreseen that the laboratory of the "Research Unit" will move to a new building in the near future. In this case it will be more difficult to cooperate with the other specialists of the other laboratories of the Faculty of Pharmacy. This Faculty is fitted up with a laboratory of pharmacognosy and a laboratory of microbiology.

The activity of the "Research Unit" is focussed on the research of remedies used by the local healers, a long and vast activity.

The persons met by the experts during their activity in Tanzania are indicated in Appendix I.

3. Considerations on the spontaneous flora

Tanzania has a vast territory consisting in savanna, hills and mountainous regions covered by a rich flora and various cultures.

In the spontaneous flora is growing a big variety of medicinal and aromatic species but the majority is not chemically studied though they are used in the traditional medicine.

The richness of the spontaneous flora was particularly noted during the travel of the mobile unit within the country in order to collect samples of medicinal plants along the routes Kabanga - Mwanza - Seronera - Serengeti - Arusha - Moshi - Dar-es-Salaam (1560 km), as well as on other directions towards Morongor (100 km), Kerogwe - Leshoto - Amani - Muheza (600 km) or in the Mereobants of Dar-es-Salaam.

Further information on the medicinal and aromatic plants was obtained from the specialists of the Botanical Department of the University and of the "Traditional Medicine Research Unit" provided with herbaria. The herbarium of the "Research Unit" has a collection of 1000 species, from approx. 1100 species described in the specialized works, which are used by the local healers for the treatment of approx. 100 affections.

On the occasion of the trips in the field the botanist of the mobile unit made demonstrations in front of the Tanzanian specialists on the methodology of quantitative evaluation of medi

cinal and aromatic plants which could be harvest yearly without disturbing the balance of the ecological system every year.

In Tanzania there are some limited preoccupations to collect and export certain medicinal species recognized by the pharmacopoeia like the seeds of *Elettaria cardamomum* from spontaneous flora and the bark of *Cinchona succirubra* but there is not a specialized unit to coordinate the gathering of a large range of medicinal and aromatic plants growing in the spontaneous flora.

Large cultures of *Agava sisalana* are located in Tanga region. This species is used as a textile plant but also as a source of hecogenine; the concentrated extract is exported. The multitude of medicinal and aromatic species growing in the spontaneous flora or in cultures could be divided into two main groups.

One group comprising 18 species listed in Appendix II includes medicinal and aromatic species growing in sufficient quantities and recognized by the majority of pharmacopoeia.

Therefore they can be used for the local preparation of medicines without any other research works or high investments in production equipment.

In the same situation are some aromatic plants for the extraction of essential oils necessary in cosmetics and especially in the soap industry.

The most part of medicinal and aromatic species used in the traditional medicine are less or not at all tested for their chemical and therapeutical characteristics.

Among those species growing in big quantities by adequate research works, one may find valuable species that can be used in the production of pharmaceuticals.

Appendix III lists 45 main medicinal and aromatic species which could surely offer the chance to identify useful active principles. In the same Appendix the useful parts of plants as well as their actual application in the traditional medicine are indicated.

A particular attention has to be focussed on the *Solanum* sp. and *Balanites aegyptiaca* species growing in the spontaneous flora in big quantities as solasodine source in the preparation of steroid hormones.

Catharanthus roseus (*Vinca rosea*) though not signaled in the spontaneous flora, is cultivated as an ornamental plant and it has very favorable conditions of growing in Tanzania.

This species is used in preparing a medicine for the treatment of leukemia.

Another very important species is *Cananga odorata* whose flowers can be a source of a high quality essential oil for the soap industry.

However for the development of an own pharmaceutical industry and for the enlargement of a range of pharmaceutical products based on local resources it would be advisable to introduce in cultures and acclimatize new species of medicinal and aromatic plants.

This development is all the more so because Tanzania has large area available even no cultivated and the necessary labour power.

In this respect the UNIDO experts handed over to the experimental station in Lushoto seeds for 20 medicinal and aromatic plants brought from Romania to be tested in the local pedoclimatic conditions.

Appendix IV presents these species as well as the main elements of cultivation.

4. Laboratory activity

The laboratory activity of the mobile unit was carried out in the laboratory of the "Traditional Medicine Research Unit" which was fitted up with a part of the necessary laboratory glass ware and apparatus. In order to prepare some pharmaceutical products the samples of medicinal plants were analysed. For instance the content of alkaloids was determined in the leaves of *Datura stramonium* and in *Cortex Cinchonae*; the results are indicated in Appendix V para. A.

From the powder of *Datura Stramonium* it was prepared tincture of *Stramonium* and from *Cortex cinchonae*, it was prepared tincture of *Cinchonae*. Other tinctures were prepared from the fruits of *Capsicum*, the leaves of *Eucalyptus globulus* and the seed of *Elettaria cardamomum*.

The results of the chemical analyses of these tinctures are presented in Appendix V para.B.

The content of essential oils from the samples of aromatic plants is indicated in Appendix V, para.C.

The high content in essential oils is noted in *Eucalyptus globulus* and *Elettaria cardamomum*.

The traditional medicine uses a great variety of plants which are less or not at all checked from a therapeutical point of view.

Besides the above mentioned chemical determinations, the UNIDO experts demonstrated to the Tanzanian specialists an identification methodology of active principles in plants with an unknown chemical composition (See Appendix VI).

The experts carried out, as demonstration, identifications of active principles in the following species : *Cissus*

which quadrangularis belongs to the Vitaceae family and it is used by the traditional medicine as an antileprous remedy. The powder has a green colour and it is obtained from leaves and the coronas of the young branches.

Hatanka is a mixture of fine powdered plants and it is used to relief the abdominal pains of "any kind".

Solanum incanum is growing in big quantities in the spontaneous flora. The dry fruits were comminuted and the experts determined the groups of active principles.

The results of the chemical identifications are indicate in Appendix VII.

The good results obtained by chemical determinations have led to the favourable conclusion of setting up an extraction and distillation unit for the medicinal and aromatic plants growing in Tanzania.

5. Guidelines for the establishment of a pharmaceutical and essential oils industry

The representatives of the Ministry of Industry showed a particular interest in actual setting up a pharmaceutical industry based on medicinal plants.

So far Tanzania has not had a production of medicines using the local resources of the spontaneous flora.

On the contrary, there is in operation at Dar-es-Salaam a factory "Keko Pharmaceutical Plant" which produces tablets, capsules and apoules using only imported raw materials and substances.

Another factory for the conditioning of medicines is under construction in Arusing expecting to start up in June 1980 and other project in Zanzibar scheduled to be put in operation with the UNIDO assistance.

This project is expected to be in operation by 1982 having the following profile and capacity in 1985:

- tablets 500 million
- capsules 20 -"-
- oral liquids and galenicals - 250,000 litres
- ointments - 10,000 kg.
- sterile powder, injection - 2 million
- sterile liquids (ampoules) - 2 million
- sterile liquids (vials) - 2 million
- intravenous fluids - 250,000 litres

The last two factories will also operate with imported raw materials.

The development in the future of a pharmaceuticals production based on medicinal plants at an industrial scale can be grafted on one of the above mentioned projects using some of their utilities.

But the first step, namely the setting up of a pilot unit of extraction and distillation has to take place within the "Traditional Medicine Research Unit".

Due to the interest shown by the local authorities the "Research Unit" has to move in the near future to another building separately from the Faculty of Medicine and therefore will have no longer access to some existing laboratory equipment owned by this faculty.

In view of the above, it will be advisable to fit up the "Research Unit" with the laboratory equipment indicated in Appendix IX.

During the consultations between the UNIDO experts and

the management of the "Research Unit", the experts emphasized the necessity of studying the medicinal plants currently used in the world therapeutics and growing in Tanzania, along with the other species used in the traditional medicine.

Based on the first category of plants it will be possible even for this "Research Unit" to prepare some products and make them available immediately for hospitals.

For instance, it is unreasonable to import some tinctures which can be locally prepared. Having in mind this idea, the experts considered both categories of plants, those ones recognized by the international pharmacopoeia and others which still arise question marks concerning the kind of alkaloids, the pharmacodynamical effects, the toxicity and the side effects.

After the consultations with the specialists of "Research Unit" and based on the medicinal and aromatic plants available in the spontaneous flora, the experts prepared 15 pharmaceutical products listed in Appendix VIII.

A pharmacist of the "Keko Pharmaceutical Plant" in Dar-es-Salaam participated in these demonstrations considering the useful co-operation in the future between the "Research Unit" and the factory for the conditioning of medicines.

The experts explained in detail to the representative of the "Keko Pharmaceutical Plant" a general methodology to obtain tinctures and extracts at the industrial scale.

At the same time, for a better understanding of the technology, the experts drew up a flowsheet of apparatus currently in use, their operation and their connections.

The experts consider that a future production unit to process the medicinal plants could be placed along with the condi-

tioning factory - "Keko Pharmaceutical Plant" - Dar-es-Salaam - in order to incorporate the vegetal extracts in pharmaceutical forms like syrups, tablets or ointments.

- Checking up the list of imported medicines it was found that Tanzania imported some simple medicines which could be locally prepared with minimum of equipment and using the local available raw materials.

As an example the compound tincture of Cardamom is imported but Tanzania exports Fructus cordamomi.

The preparation of this tincture by the UNIDO experts aimed to demonstrate the possibility of replacing some imports by products based on the medicinal plants growing in the spontaneous flora.

Taking into account the rich spontaneous flora in medicinal plants and the possibility to develop cultures for some valuable species, it appears necessary and useful to set up, as a first step, a pilot unit for the distillation and extraction of active principles in order to organize locally the production of some pharmaceutical preparations with all advantages for the benefit of a country like Tanzania.

6. Findings

- 6.1. Tanzania has a very rich spontaneous flora and some cultures of medicinal and aromatic plants but there are not reliable data about their quality and an evaluation of the quantity which could be harvested yearly as a material basis for industrial purposes. At present there is no local production of medicines based on medicinal plants.
- 6.2. The traditional medicine is actively used to cure some specific diseases and in this respect many herbs and mixtures are prescribed by the local healers but they have not been checked up for their chemical composition and therapeutical effects.
These research works need time and adequate technical means. The "Traditional Medicine Research Unit" has just started such a kind of research.
- 6.3. There is an organization which collects seeds of Elettari cardamom and the bark of Cinchonae for export but there is not an organization to control the gathering of other species of medicinal and aromatic plants.
- 6.4. There are not organized preoccupations to acclimatize and to introduce in culture valuable species of medicinal plants to enlarge the range of natural resources.
- 6.5. The laboratory of the "Traditional Medicine Research Unit" is partially fitted up for some chemical determinations of active principles but in the future it is advisable to complete the equipment.
- 6.6. The personnel of this "Research Unit" is not sufficient and, as priority, it is necessary to organize the training in the field of medicinal and aromatic plants processing,

taking into account the intention of the local authoritie
to have a production of medicines.

- 6.7. There is not a pharmacodynamical laboratory to check the pharmaceutical products which are to be produced in the near future.
- 6.8. Although the Ministry of Industry and others local authorities showed interest in a production of medicines as soon as possible based on the medicinal plants recognized by the international pharmacopoeia, at present the activity of the "Research Unit" is focussed mainly on the remedies prescribed by the healers which use plants generally not accepted by the international pharmacopoeia. Therefore, it will be difficult and it takes some time until such plants will be scientifically checked up and become reliable for an industrial production.

7. Recommendations

Taking into account the rich spontaneous flora and the possibilities to develop cultures of medicinal and aromatic plants as well as the interest of the Governmental authorities to set up a pharmaceuticals production based on these plants, the UNIDO experts submit the following recommendations :

7.1. The Botanical Department of University and the "Traditional Medicine Research Unit" with international assistance have to elaborate a programme to identify the medicinal and aromatic plants growing in the spontaneous flora including an evaluation of the quantity of plants which can be harvested yearly without disturbing the ecological system for each region.

7.2. The setting up of a specialized organization to control and to collect the medicinal and aromatic plants useful for pharmaceutical preparations or for export.

This organization could organize the setting up of experimental stations in favourable zones (Arusha, Lushoto, Amani, Morogoro a.), study the acclimatization and the introduction in culture new valuable species. In order to help the workers who will collect the medicinal plants it would be advisable to issue leaflets describing in the vernacular tongue and through drawing the part of the plants to be collected and their conditioning.

7.3. Taking into account the use of a large range of herbs in the traditional medicine it is necessary that the "Traditional Medicine Research Unit" should go further with the scientific screening of these herbs and select those which are really useful and reject those which present risks of toxicity.

7.4. In order to assure the necessary local skilled personnel it is absolutely urgent to select at least three Tanzanian specialists to be trained in the frame of UNIDO training programme in the field of medicinal and aromatic plant processing, as fellowship-holders. The selected candidates should be : botanist or agronomist, analyst (pharmacist or chemist) and technologist (pharmacist). This training programme should be organized in a country with a large experience in the processing of medicinal plants.

7.5. Assistance of international experts to train locally the Tanzanian specialists and to develop the research and the production activity in the field of manufacturing pharmaceutical products based on medicinal and aromatic plants.

The following experts are suggested :

- one botanist for 3 months - preferable period: May-Sept.

- one phytochemist for 3 months, in the same period, as the botanist. Both experts have to go to Tanzania after the delivery of the laboratory equipment mentioned in Appendix IX.

- one technologist for 3 months - He should go to Tanzania after the delivery of the equipment for distillation and extraction pilot unit mentioned in Appendix IX.

The technologist has to supervise the installment of the equipment and to assist the local specialists to start up the production of the medicines.

7.6. In the near future, it is advisable to set up a pharmacodynamical laboratory with the assistance of an expert to assure the control of more sophisticated medicines in view of the development of a pharmaceutical industry.

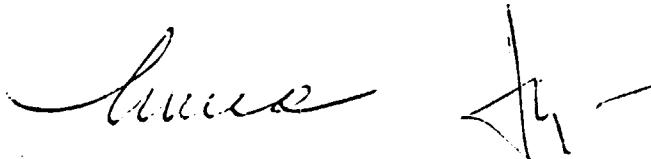

7.7. In order to organize a small scale production of medicines based on medicinal and aromatic plant it is necessary to complete the laboratory equipment available at the "Traditional Medicine Research Unit" and to set up a pilot unit for distillation and extraction of active principles.

The necessary equipment is indicated in Appendix IX.

X X
 X

During the mission the experts drew up a project proposal concerning the further assistance to Tanzania as mentioned above based on the discussions held with the representatives of the Ministry of Industry and the management of the "Traditional Medicine Research Unit".

The draft of project proposal is presented in Appendix X and the assistance is estimated at U.S.\$187,000.-

List

of the pharmaceutical products prepared by the UNIDO

1. Cardamom tincture

contains :

- Fructus cardamomi - 200 gr.

- Alcohol aethylicus 70° q.s. ad. 1000 ml.

Indications: Light carminative, flavouring and rectifying the taste and the odour of various preparations.

Contraindications: none

Dose : 5 ml.

2. Compound Cardamom tincture

contains :

- Fructus Cardamomi - 14 gr.

- Fructus Carum carvi - 14 gr.

- Cortex Cinamomi - 2 gr.

- Cochineal - 7 gr.

- Glycerinum - 50 ml.

- Alcohol aethylicus 60° q.s. ad. 1000 ml.

Indications: Carminative and stimulator in the treatment of chymical and inflammatory dispesies.

Contraindications: none

Dose : 2 - 5 ml.

3. Cinchona tincture

contains :

- Cortex Cinchonae - 200 gr.

- Acidum hydrochloricum dilutum 10 ml.

- Alcohol aethylicus 70° q.s. ad. 1000 ml.

Indications: Internal : bitter tonic. before meals.

External : Capillary lotion by vessel dilatation.

Contraindications: pregnancy, nurse period, haemolytical anaemia.

Dose : Adults : 2 - 5 gr./day

Children: 3-5 years - 0.5 gr/day

6-10 " - 1 gr/day

11-15 " - 2 gr/day

4. Capsici tincture

contains :

- Fructus Capsici - 100 gr.

L i s t

of the pharmaceutical products prepared by the UNIDO

1. Cardamom tincture

contains :

- Fructus cardamomi - 200 gr.
- Alcohol aethylicus 70° q.s. ad. 1000 ml.

Indications: Light carminative, flavouring and rectifying the taste and the odour of various preparations.

Contraindications: none

Dose : 3-6 ml.

2. Compound Cardamom tincture

contains :

- Fructus Cardamomi - 14 gr.
- Fructus Carum Carvi - 14 gr.
- Cartex Cinamomi - 28 gr.
- Cochineal - 7 gr.
- Glycerinum - 50 ml.
- Alcohol aethylicus 60° q.s. ad. 1000 ml.

Indications: Carminative and stimulator in the treatment of chronical and immflammatory dispepsies.

Contraindications: none

Dose : 2 - 5 ml.

3. Cinchonae tincture

contains :

- Cartex Cinchonae - 200 gr.
- Acidum hydrochloricum dilutum 10 ml.
- Alcohol aethylicus 70° q.s. ad. 1000 ml.

Indications: Internal : bitter tonic. before meals.

External : Capillary lotion by vesseldilatation.

Contraindications: pregnancy, nurse period, haemolitical anaemia.

Dose : Adults : 2 - 5 gr./day

Children: 3-5 years - 0.5 gr/day

6-10 " - 1 gr/day

11-15 " - 2 gr/day

4. Capsici tincture

contains :

- Fructus Capsici - 100 gr.
- Alcohol aethylicus 70° q.s. ad. 1000 ml.

Indications: Internal : carminative

External : revulsive for rheumatic and neurologic pains.

Contraindications: Internal : gastric inflammations.

Dose : Internal : 0.5 gr/once and 1.5 gr/day.

5. Colae tincture

contains :

- Semen Colae - 200 gr.
- Alcohol aethylicus - 70° q.s. ad. 1000 ml.

Indications : Stimulus of the central nervous system for infectious diseases, tiredness, depression dispositions.

Contraindications: Children under 3 years.

Dose: adults : 2 - 10 gr/day

children: 3 - 5 years - 1 gr/day
6 -10 years - 1.5 gr/day
11 -15 years - 2 gr/day

6. Eucalypti tincture

contains:

- Foliu Eucalypti - 200 gr.
- Alcohol aethylicus 70° q.s. ad. 1000 ml.

Indications: - light disinfectant, anaesthetical and astringent effects on mucous membranes.
- internal : Antiseptic for breathing apparatus, and for the uro-genital ways.

Contraindications: none.

Dose: adults : 2 - 10 gr/day.

children: 0.2 gr/year age.

7. Stramonii tincture

contains :

- Foliu stramonii - 100 gr.
- Acidum sulfuricum - 10 ml.
- Alcohol aethylicus q.s. ad. 1000 ml,

Indications : Asthma emphizem, neuroses, spasms of non-striated muscles.

Contraindications: Costiveness, glaucoma, prostatic affections, atrial fibrillation.

Dose : 0.5 ml/once but 1.5 ml/day.

max. dose : 1 ml/once and 3 ml/day.

8. Coffee tincture

contains:

- Coffee - 200 gr.
- Aqua distillata - 600 ml
- Alcohol aethylicus - 500 ml

Indications: stimulus of the central nervous system during convalescence.

Contraindications: - gastric ulcer or gastritis with hyperactivity.

- children under 3 years old

Dose : adults : 5 - 15 gr/day

children : 3 - 5 years : 2 gr/day

6 -10 years : 3 gr/day

11 -15 years : 4 gr/day.

9. Tonic tincture

contains :

- Cinchonae tincture - 50 ml
- Collae tincture - 50 ml

Indications: Bitter tonic and light nervous stimulus.

Contraindications: Children under 3 years old, pregnancy, during nurse period.

Dose : 1 coffee spoon in a glass of water, twice a day.

10. Tonic

contains :

- Natrium phosphoricum - 15 gr
- Cinchonae tincture - 30 ml
- Coffee tincture - 30 ml
- Glycerinum - 50 ml
- Wine q.s. ad. 1000 ml

Indications: Bitter tonic for light digestive disturbances.

Contraindications: Children under 15 years old

Dose : 1½ coffee spoon in ½ glass of wine, one hour before meals.

11. Antirheumatic solution

contains :

- Capsici tincture - 10 ml
- Methylium salicylicum - 3 ml
- Ammonium hydricum solutum - 5 ml
- Alcohol aethylicus - 50 ml
- Aqua distillata q.s. ad. 1000 ml

Indications : Rheumatical affections of joints, chronical and evolutive polyarthritis. Revulsive with analgesic and local antiinflammatory effect.

Contraindications: It is not used on irritated skin.

Dose : Light embrocation on painful sides.

12. Sedative syrup

contains :

- Natrium bromatum - 2.5 gr.
- Calcium bromatum - 2.5 gr.
- Stramonii tincture - 2 ml.
- Natrium benzoicum - 2 gr.
- Syrupus simplex - 30 ml.
- Aqua distillata q.s. ad. 100 ml.

Indications: Sedative and antispasmodic for children with restlessness, insomnia, tooth disorders or whooping cough.

Contraindications: none.

Dose : 1 year - 1 coffee spon/day

2 years - 1½ " "

3 " - 2 " "

4 " - 1 spoon

13. Disinfectant of bucal cavity

contains:

- Acidum benzoicum - 3 gr.
- Mentholum - 0.5 gr.
- Oleum Eucalypti - 0.5 gr.
- Eucalypti tincture q.s. ad. 100 ml

Indications : Antiseptic of the bucal cavity in the treatment of pharingitis, stomatitis.

Contraindications: It is not recommended for children.

Dose : 10-15 drops in $\frac{1}{2}$ glass of water - twice gargles per

14. Antispasmodic and antiacid powder

contains :

- Folium stramonii (0.25%) - 4 gr.
- Bismuthum Carbonicum basicum - 30 gr.
- Calcium carbonicum praecipitatum - 20 gr.
- Magnesium oxydatum - 15 gr.
- Kaolinum - 15 gr.
- Oleum citronellae - 15 drops

Indications: Ulcer- it acts as a gastric binding with antispasmodic and antiacid effect.

Contraindications: Costiveness.

Dose : 1 spoon in $\frac{1}{2}$ glass of water twice/day.

15. Tablets with analgesic and antifever effects, as well as cardiotonic effect.

contains :

- Cinchonae pulvis - 0.10 gr.
- Acidum aethylsalicylicum - 0.30 gr.
- Coffeinum - 0.04 gr.
- Amylum - 0.04 gr.
- Talcum - 0.02 gr.

Indications: Fever dispositions, migraines, influenza, rheumatism, cardiotonic effect.

Contraindications: gastritis, ulcer. liver and kidney affections.

Dose : 2 - 4 tablets/day. In case of acute fever dispositions up to 6 tablets/day, 2 tablets each 3 hours.

List

of laboratory equipment for the "Traditional Medicine
Research Unit" - Dar-es-Salaam

<u>ITEM No.</u>	<u>DESCRIPTION</u>	<u>QUANTITY</u>
1.	Complete TLC Set	
a)	UV lamp (240 V. main)	1
b)	Set of laboratory spray gun	3
c)	Unoplan Leveller model SA MK 11	1
d)	Universal TLC Chromatank	4
e)	Multiple Plate Chromatank	2
f)	Chromajars	12
g)	Spotting jigs .	4
h)	Chromaplate racks	6
i)	Universal Sheet Chromatank	2
j)	Ultraviolet Contrast control goggles	2
k)	Packets of Stainless Sheet wire clips	3
l)	Chromaklip	1 packet
m)	Dip tray (51 x 21 cm)	1
n)	TLC Plates-pre-coated (20 x 20 cm)	10 boxes
o)	Whatman Chromatography paper grade 1	2 boxes
p)	Grade 3 MM Whatman paper	2 boxes
2.	Rotavapeur	1
3.	Fraction Collector	1
4.	Vacuum Pumps	1
5.	Water Circulators (pumps)	3
6.	Freeze dries	1
7.	Cylinders (N ₂ , CO ₂ , H ₂ , Air)	12
8.	U.V. Spectrophotometer & accessories	1
9.	I.R.Spectrophotometer with hydraulic press	1
10.	p.H. meter	1
11.	Grinder	1
12.	Commercial blender	1
13.	Water cooler	1
14.	Colorimeter	1
15.	Glass-ware dryer	1
16.	Mechanical stirrer	4
17.	Vacustat	3
18.	Melting point apparatus	2
19.	Hot air dryer	1
20.	Heating Coils (different sizes)	6
21.	Dimmerstat	6
22.	Research Microscope with camera (Wickers)	1
23.	Dissecting microscope	1
24.	Microtome	1
25.	Flask Shaker	1
26.	Vortex Mixer	1
27.	Sieves (10 - 300)	One Set
28.	Sieve Shaker	1
29.	Sample divider	1
30.	Heating Mantles 1 lit, 3 lit, 5 lit, 10 lit 2 each	
31.	Glassware washing machine	
32.	Autoclaves	1
33.	Double distillation water still	1
34.	Apparatus for determinations of essential oils	1

TOTAL : 50,000/-

Estimated cost: 43,500 \$
Transport 15% : 6,500 \$

L i s t

of equipment for an extraction and distillation
pilot unit

No.	Denomination	Quantity pieces
1.	Percolater : 50 l Material : stainless steel	1
2.	Percolater : 30 l Material : Stainless steel	5
3.	Concentrater with heating jacket and vacuum pump - capacity : 50 l Material : Stainless steel	1
4.	Refrigerater - 2 m ³ Material : coil in stainless steel	1
5.	Vessel of sedimentation 50 l Material : stainless steel	1
6.	Collecting vessel 50 l Material : stainless steel	1
7.	Vessel for the preparation of syrups with heating jacket and stirring system. Capacity : 300 l Material : stainless steel	1
8.	Press filter-frame 20/20 cm	1
9.	Pump - H = 4 m	1
10.	Steam generator 1,5 t/h	
11.	Collecting vessels 20 l Material : stainless steel	5
12.	Distillater with florentin vessel for essential oils Capacity : 150 l. Material : stainless steel	1
13.	Balance 5 - 100 Kg.	1

TOTAL estimation cost including transport : 85,000

UNITED NATIONS INDUSTRIAL DEVELOPMENT ORGANIZATION

Project Proposal

Part A.- Basic Data

Country: United Republic of Tanzania

Project No: Project title: Assistance programme for

Scheduled start: May 1980. the valorization of medi-

Scheduled completion: 1981. cinal and aromatic plants

Origin and date of in order to prepare medi-
official request: cines.

Part B.- Narrative 1. Background and justification

The development of traditional medicine based on available medicinal plants in developing countries is one of the very important programme of UNIDO..

Several programmes for different developing countries have been designed and some of them are already under implementation. The utilization of medicinal plants in the developing countries has always been known and the majority of the population of these countries are using extracts or dry herbs for treating many tropical diseases.

Due to the increase of medicines demand in the world and in the developing countries, it merits attention to explore the possibility of manufacturing pharmaceutical products, on a more economical basis, based on active principles of medicinal plants.

The flora of Tanzania is very rich in medicinal and aromatic plants and therefore it is worth to process these plants in order to get extracts and essential oils.

In December 1977 UNIDO organized an exploratory mission in Tanzania under the project RP/RAF/77/C15 to collect information and data on the available plants and facilities for the setting up of a pharmaceutical industry.

Following this mission a mobile unit and UNIDO experts were sent to Tanzania in January 1980 to collect samples of medicinal and aromatic plants for quantitative and qualitative determinations of active principles as well as for the demonstration of the possibility of preparing locally pharmaceutical products based on these active principles in co-operation with the local specialists.

The activity of the mobile unit was carried out in the laboratories of the "Traditional Medicine Research Unit" belonging to the Faculty of Medicine - Muhimbili Medical Center and in co-operation with the specialists of the Botanical Department of the University Dar-es-Salaam.

The pharmaceutical products and the results obtained during the joint activity of the mobile unit and the local specialists, have proved the possibility of setting up of a small scale production of pharmaceutical products based on the raw materials available in Tanzania under the condition of a further assistance programme.

2. Objectives

2.1. Development objectives

The programme will lead to the establishment of a national level extraction and purification unit for plants which are locally available. Furthermore, the extracts of plants will be used to formulate pharmaceutical preparations which will be incorporated in the health programme of the country. The establishment of such a unit will lead to economic advantages and to the creation of a labour intensive industry which will be for the benefit of the farmers since these plants are not currently exploited.

2.2. Immediate objectives

- a/ Development of production technologies of medicines based on medicinal plants;
- b/ Training of local personnel.

3. Project outputs

- Government policy on the development of a pharmaceutical industry based on medicinal and aromatic plants locally available.
- A survey on the quantity and quality of the natural resource in this field.
- Development of the research work on the medicinal plants and their use in the pharmaceutical industry.

4. Project activities

The main activities of the project are the following :

4.1. Training of the local personnel in the field of culture and processing of medicinal and aromatic plants in order to get medicines.

UNIDO will organize a training programme for 4 fellowship-holders (botanist, agronomist, phytochemist and technologist) in a country with a large experience in the processing of medicinal plants and their use in the pharmaceutical industry, during 1980.

4.2. International experts to train locally the Tanzanian specialists in this field. They have to contribute to the development of research and production activity in the field of manufacturing pharmaceutical products based on medicinal plants. Three experts : one botanist - 3 months (in the period May - September); one phytochemist - 3 months and one technologist - 3 months - to come in Tanzania after the fulfilment of the above mentioned two experts mission.

4.3. Supplying the necessary laboratory equipment and materials to develop the laboratory work at the "Traditional Medicine Research Unit" and the production equipment to set up a pilot unit of extraction and distillation of active principles.

5. Project inputs

5.1. The UNDP's contribution will be the following :

	<u>Estimated budget in US\$</u>
5.1.1. Fellowships for the local personnel to be trained abroad in 1980	12,000.-
-4 fellowshipholders x 3000 \$	-

Estimated
budget in US.

5.1.2. International experts to train Tanzanian specialist and to develop research and production activities in the field of manufacturing pharmaceutical products

- Period : 1980 - 1981

- 3 experts x 3 months = 9 m/m

40,500.-

5.1.3. Supplying of laboratory equipment and of pilot unit equipment for extraction and distillation (See Appendix IX)

135,000.-

Estimated US; 137.500
assistance
cost

5.2. The Tanzanian Government will make available :

- Necessary space (room) for the setting up of pilot unit including the assemblage.
- National personnel for the laboratory works and the operation of the pilot unit.
- Raw materials (medicinal plants) and ingredients for the preparation of pharmaceutical products based on medicinal plants.
