Preface

This second volume of the publication *Input-Output Tables for Developing Countries* contains 16 tables for 15 developing countries and areas. The reference years of the tables range from 1970 to 1975.

The methodological introduction to volume I will also prove useful in the interpretation of the tables in volume II. It describes the central problems of compilation and establishes a sound conceptual basis for the interpretation of the input-output technique. The characteristics of national accounts and input-output systems are presented and the consistencies and divergencies between the two systems explained. A theoretical overview of the interindustry system prepares the reader to enter into more detailed problems of the compilation. Possible alternative approaches, the different valuation techniques, the use of various prices and the concepts and methods in handling imports are treated extensively. Volume I contains 20 country tables with in some cases very detailed technical descriptions.

The tables in volume II provide a useful data base for studies on the structure of developing economies. Data were obtained from publications of national statistical services and international organizations. The original tables have not been standardized, although partial readjustments have been made. The purpose of the readjustments was to make the data presentation uniform, in particular the treatment of domestic and import transactions. The main objective was to make the reading of tables included in this volume relatively easy. All tables contain data on the industry breakdown of gross output, value added, total final demand and total intermediate inputs and deliveries. All of these values occur in a stable position within the framework of the tables and are an important source of information for economic analysis.

The tables included in this volume do not have a uniform industry classification, and thus do not allow for direct comparisons. The main obstacle to comparability is the different treatment of imports. Some tables contain a full import transaction matrix, while some contain no information on the pattern of allocation of imports. However, most contain a row with data on total imported inputs by industries and final demand components. Other obstacles to comparability are unallocated inputs and outputs, which occur quite frequently, and different breakdowns by industries. However, the tables are rather homogeneous from two important points of view. Almost all are valued at producers' prices (and not at purchasers' prices or approximate basic values), and the rows and columns of most tables represent industries and not commodity groups.

The user of the tables can unify the classifications. The common industry breakdown chosen will depend on the purpose of the investigation. Further problems of comparability of tables included in this volume must be

considered. These problems will be discussed in part one. In the first section the three types of tables based on the availability of data on import transactions are described. The second section deals with other problems connected mainly with the change in the methodology of national accounting, which came after 1968, and its relation to input-output statistics.

EXPLANATORY NOTES

For technical reasons, the method of presentation of statistical data in tables may not follow normal practice.

Part one

PROBLEMS OF COMPARABILITY, CLASSIFICATION AND STANDARDIZATION

A. The principal problem of comparability of input-output tables: availability of data on import transactions

The earliest input-output tables contained information on total transactions only. Transactions of goods and services of domestic origin were combined with transactions of imported goods and services. Advances in input-output methodology¹ allowed for the separation of data on these two sources of goods and services² and made it possible separately to show their allocation to receiving industries and to final demand components.

¹Canada, for example, has a very good statistical service, but domestic and import flows in its input-output tables are still not separated: "We notice that some countries produce intermediate transaction matrices broken down into domestic production versus imports. They must have formidable basic records to produce such tables. Or, maybe, they are far more imaginative than we are" (K. Lal, "Compilation of input-output tables: Canada"). Bengt Thage describes the approach used in his country in "Techniques in the compilation of Danish input-output tables: a new approach to the treatment of imports". Both studies are included in J. V. Skolka, ed., *Compilation of Input-Output Tables* (Berlin, Springer Verlag, 1982).

²A great obstacle to the comparability of input-output tables is the compromise treatment of imports found in input-output tables published during the 1960s, a practice which is fortunately disappearing. In these tables, imports were classified as either competitive or non-competitive. The former included goods and services which could be substituted, the latter goods which could not be substituted for by domestic output. The criterion of substitutability differed substantially among countries, was often imprecise and changed over time. Goods which are not produced in a given country (for example, a developing country) for technological reasons may be produced in a more or less distant future. Goods which cannot be produced for objective reasons, such as climate, may in future be substituted for by new products. In this type of input-output table competitive imports are presented in the matrix of intermediate and final uses, while non-competitive imports are given in a row at the bottom of intermediate consumption and of final demand. It is a serious error to treat non-competitive imports as a component of value added, although this occurs frequently in earlier input-output tables.

Tables included in this volume can be divided into three groups according to the treatment of total, domestic and import transactions.

The first group represents the simplest type of input-output table. In this traditional type of table, the first and second quadrants (i.e. the tables of intermediate deliveries and of deliveries to final demand) contain information on total transactions only. Information on value added and its breakdown is given in the third quadrant (below the first one); the total of intermediate inputs and gross value added gives gross output values. These are complemented at the bottom of the input-output tables by information on imports by industries of origin. The sum of gross output values and imports gives total resources. The column totals are then identical with the row totals over the first and second quadrants—that is, the input-output table shows, by rows, the distribution of total resources.

The matrix of total input coefficients can be calculated from this and show, by columns, the Leontief linear production technology. The table also provides useful information on the structure of final demand components by delivering industries, on the industry structure of value added of gross output value and on imports by delivering industries. The inverse matrix of total input coefficients, however, cannot be realistically interpreted, or it can only be interpreted under the unrealistic assumption of full autarky of the country. The use of this type of input-output table for analytical purposes is therefore limited.

Four of the input-output tables included in this volume contain data of this form. These include the input-output tables for Egypt (1973), India (1974), Indonesia (1975) and Morocco (1975). India and Indonesia are large developing countries, which are not very dependent on imports. Their tables could be used, although with caution, for certain purposes, including the construction of input-output models. The other two countries, Egypt and Morocco, are middle-size countries which rely heavily on imports. The possibilities of using their tables for analytical purposes are therefore limited.

The second type of input-output table³ contains information on total, domestic and import matrices. In each cell of the first and second quadrant the data on total transactions can be split into a domestic and an import component. Presentation of these tables in statistical publications differs. Some publications show in each cell of the table the value of total, domestic and import transactions.⁴ In this volume a simpler form of presentation was chosen. The input-output table is, in principle, presented in the same way as the input-output table of the first type. The matrix of import transactions is inserted between total transactions (in the first and second quadrant) and the value-added matrix (in the third quadrant). Gross output values and imports (by industries of origin) are treated in the same way as in the first type. The last row of totals at the bottom contains information on total resources, which is

³The Economic Commission for Europe has called tables of the second type "Version A" and tables of the first type "Version B". *Standardized Input-Output Tables of ECF Countries for Years around 1959* (United Nations publication, Sales No. E.72.II.E/Mim.9), p. 8.

⁴Publications of the Economic Commission for Europe of the United Nations Secretariat and of the Statistical Office of the European Communities (Eurostat): *Standardized Input-Output Tables of ECF Countries for Years around 1959* (United Nations publication, Sales No. E.72.II.E/Mim.9); Office statistique des Communautés européennes, *Tableaux entrées-sorties pour les pays de la Communauté économique européenne* (Brussels, 1965); Office statistique des Communautés européennes, *Methodologie der Gemeinschaften der Input-Output Tabellen* (Luxembourg, 1979); Eurostat, *Input-Output Tables: the Nine and the Community, 1970* (Luxembourg, 1979); Eurostat, *National Accounts ESA: Input-Output Tables 1975* (Luxembourg, 1983).

identical with the row totals over the first and second quadrant of the table of total transactions. The row totals of the matrix of import transactions show the structure of imports by industries of origin, and are thus identical with the import row located between gross output values and total resources. The column totals show total imports by importing industries and total direct imports to final demand components.

Separate tables of domestic transactions are not contained in this second type of table. These, however, can be easily calculated by subtracting the matrix of import transactions from that of total transactions.

This table allows for the calculation of the following three types of input coefficient: total inputs, domestic inputs and imported inputs. The matrix of total input coefficients is only suited for the analysis of production technology. The inverse of the matrix of domestic input coefficients has a meaningful economic interpretation. It can be multiplied both by the matrix of imported input coefficients—resulting in a matrix of full imported input coefficients—and by the matrix of value-added coefficients—resulting in a matrix of value-added multipliers.

The second type of input-output table provides all information required for the analysis of economic structures and import dependency. It also provides the basis for the construction of input-output models. In this volume, four such input-output tables are presented, those for Argentina (1970), Haiti (1975/76), Singapore (1973) and Thailand (1975).

The third type of input-output table occupies an intermediate position between the two types outlined above. In the first and second quadrants it contains matrices of domestic transactions. At the bottom of both quadrants there is a row of import totals, both for the imports of intermediate demand (by importing industries) and for direct imports to final demand (by final demand components). Below this row, there is a third quadrant containing data on value added and gross output value. Data on total resources and on imports by industries of origin are not available.

The matrix of domestic input coefficients and an aggregate row of imported input coefficients can be calculated from this table. The inverse of the matrix of domestic input coefficients has a meaningful economic interpretation. It can be multiplied both by the row of the aggregate imported input coefficients and by the matrix of value-added coefficients.

Tables of this type have important applications in various analytical studies. Their use in investigations of import dependency, however, is limited. In this volume, the third type of input-output table appears most frequently. It is represented by six tables for the following countries: China (Taiwan Province) (1971 and 1974), Fiji (1972), Guatemala (1971), Rwanda (1970) and the United Republic of Tanzania (1970).

Availability of data on import transactions is the main criterion for comparability of tables included in this volume. It divides the set of these tables into three homogeneous subsets of four, four and nine tables, respectively, each corresponding to one of the three types outlined above. These subsets can be merged into two less homogeneous groups, the first one—with limited analytical use—containing eight tables of the first and second type, the other one containing thirteen tables of the second and third type. The latter set has much broader applications.

B. Other aspects of comparability of input-output tables

The main adjustment made to the original tables was their adaptation to the three standard frameworks discussed above. In addition, figures on various totals and subtotals (e.g. total intermediate inputs, gross value added, total resources etc.) missing in the original data sources were calculated. No other adjustments were made.

There remain serious comparability problems of which the user of this volume should be aware. These are of a complex nature and have no obvious solution. A knowledge of them is critical in order to avoid drawing oversimplified or false conclusions.

National accounts and input-output tables

Input-output tables are an important source of economy-wide statistical information. Some users of input-output tables may wish to rely only on the input-output tables in their presented form and apply input-output models. Other users, probably a majority of them, may wish to incorporate the input-output data into a broader context in order to analyse the interdependencies in the economy. In this case they will be confronted with the problem of consistency between input-output and national accounts statistics. A brief review of the history of this problem and of the current practice may therefore be useful.

The integration of input-output and national accounts statistics is a traditional aspiration of economic statisticians. The first input-output tables (e.g. for the United States in 1919 and 1929, and for the Federal Republic of Germany and Hungary during the 1950s) were not compiled by statistical offices, but were the product of empirical economic research. Statistical offices quickly realized that the cross-checking system built into these tables can substantially improve the quality of national accounts and started to follow the new avenues opened to them. Already at the First International Conference on Input-Output Techniques⁵ (held at Driebergen, Netherlands, in 1950), several participants discussed the relationship between input-output and national accounts statistics. The topic was also on the programme of the second conference of this type (held at Varenna, Italy, in 1954).⁶ In 1955, the Conference of European Statisticians (a body of the Economic Commission for Europe) established a working group whose main task was to collect information on experience in input-output compilation of national statistical offices—at that time restricted to the statistical offices of the countries of Western Europe—and to examine the feasibility of drawing up international standards.⁷ The exercise was repeated nine years later in 1964, at the time with active participation of one of the centrally planned economies (Hungary).⁸ The

work continued in the United Nations Statistical Office in New York, which prepared an input-output manual first published in 1966⁹ and revised in 1973.¹⁰

The breakthrough came in 1968, when input-output tables became an integral part of the United Nations System of National Accounts,¹¹ at least in theory. In practice, only a few statistical offices were able to implement the new methods immediately; for example, those of Denmark, the Netherlands and Norway, where input-output work was from the very beginning introduced as an aid in compiling national accounts.¹² In some countries this transformation was achieved a few years later, and in other countries it still remains an unfulfilled task.

At present, reliable information concerning the compatibility of input-output and national accounts statistics for individual countries is not available. UNIDO was unable to obtain such information for the countries included in this volume. The user of these tables can, however, roughly check the degree of comparability. The input-output tables contain values of several important indicators identical to those in the national accounts, such as gross domestic product, value added by industries, total private and public consumption, total fixed capital formation, total exports and imports. Where there are no or only minor differences between their values in the national accounts and in the input-output statistics, one can assume that the two data systems are compatible.

The outcome of such a compatibility check can also be helpful in the assessment of inter-country comparability of input-output tables. International methodological standardization of national accounts is quite advanced. Methodological differences in input-output tables between countries are unlikely in the case of comparable input-output and national accounts statistics within countries.

Certain input-output tables directly reveal their incompatibility with other statistical sources. These tables contain rows and columns of "unallocated" items, also designated as statistical discrepancies, unclassified, unspecified etc. The unallocated items suggest that methods and sources employed in the compilation of the input-output table differed from those of the national accounts. However, this is not necessarily true and cannot provide the basis for drawing any conclusions, particularly since such discrepancies may have been removed mechanically (for example, the RAS procedure is often used for such purposes). Clearly tables which contain statistical discrepancies are not fully comparable with complete tables. For purposes of comparison, these discrepancies must be removed. In the present volume the input-output tables of the following countries contain rows or columns with six unallocated items: Argentina (1970), China (Taiwan Province) (1971 and 1974), Indonesia (1975), Thailand (1975) and the United Republic of Tanzania (1970). It should be

¹¹*A System of National Accounts*, Studies in Methods, Series F, No. 2, Rev. 3 (United Nations publication, Sales No. E.69.XVII.3). The earlier versions were published in 1953, in 1960 (Rev.1) and in 1964 (Rev.2). On the new system see also A. Aidenoff, "Input-output data in the United Nations System of National Accounts", *Contributions to Input-Output Analysis*, A. P. Carter and A. Brody, eds. (Amsterdam, North Holland Publishing, 1970), pp. 349-368.

¹²O. Aukrust, "Problems of input-output statistics", *Compilation of Input-Output Tables*, J. V. Skolka, ed. (Berlin, Springer Verlag, 1982).

noted, however, that the consistency of data is the critical problem in the relation between national accounts and input-output statistics.

The methodology of national accounting influences the input-output statistics very strongly in the breakdown of the economy and in the valuation of transactions.

Economy disaggregation in the input-output tables

In the input-output table the economy is disaggregated into a number of sectors. The table records the transactions between the different sectors. The conceptual development of the economy disaggregation was a slow process. The current practice in input-output statistics is the result of necessary compromises between certain theoretical principles and practical considerations. Input-output theory requires that each segment be homogeneous. It should produce a single product or several products which are either perfect substitutes for one another or are produced in strictly fixed proportions, and this single product should have only one input structure. There should be no substitution possibilities between products of different segments of the economy. These theoretical requirements were constrained by the realities of data compilation which usually determined the concept of the statistical unit employed.

The statistical unit could be a commodity group, an establishment such as a farm, an activity such as trade or construction, or an institution organizing a branch of the economy or government agency.¹³ In most earlier input-output tables one finds a mix of all four concepts. Data were most frequently compiled for establishments, but because the commodity and activity concepts were considered to be closer to the ideal requirements of the input-output model, the originally compiled data were adjusted to the commodity breakdown by transfers of secondary products, which were sometimes even recorded as sales—that is, as real interindustry transactions.

An important breakthrough of the 1968 System of National Accounts was the integration of input-output tables in the framework of national accounts. For input-output statistics, the System of National Accounts uses only two types of economy breakdowns, by commodities¹⁴ and by industries,¹⁵ which are combined in two different tables. The commodity concept is based on the decomposition of output according to the nature of produced goods and

¹³*Problems of Input-Output Tables and Analysis* . . . pp. 29-30.

¹⁴"Commodities are goods and services normally intended for sale on the market at a price that is designed to cover their costs of production. Included are all goods and services produced by industries, all imported goods and services except direct purchases abroad on current account by government and households, and that part of the gross output of producers of government services and of private non-profit services to households which is sold on the conditions characteristic of sales of commodities" (A System of National Accounts (1968), *op. cit.*, p. 231).

¹⁵"Industries are all resident establishments and similar units, public as well, which produce goods and services for sale at a price which is normally intended to cover their costs of production; government units engaged in selling goods and services to the public which are characteristically commodity though as a matter of policy the prices set for the items do not approximate the costs of production; activities such as ancillary government enterprises, owner-occupied dwellings, subsistence farming or community construction projects, which produce similar goods and services and use similar processes and resources as the typical industries though they do not produce for the market; resident units which both acquire financial assets and incur liabilities in the market; and private non-profit bodies which mainly serve enterprises and are entirely, or mainly, financed or controlled by enterprises" (A System of National Accounts (1968), *op. cit.*, p. 234).

services, the industry concept on the decomposition of output according to output-producing statistical units. There is a close, but not absolute, correspondence between the two concepts. In both cases the statistical unit of data compilation is the establishment.¹⁶

The two concepts usually result in a different number of elements. These are combined into two basic input-output matrices which are, as a rule, rectangular.¹⁷ One of these matrices is called the absorption or use matrix. Its typical element represents the amount of a certain commodity used (in a row) as an intermediate input in a certain industry (in a column). The other matrix is usually called the make matrix. Its typical element is the output of a certain commodity (in a column) by a specific industry (in a row). It is almost diagonal, presenting the characteristic products in the output of particular industries. Subsidiary production appears outside the main diagonal.

The two basic tables can be rearranged into a quadratic form which result either in a commodity \times commodity or an industry \times industry table.¹⁸ It is also possible to construct a quadratic commodity \times industry or industry \times commodity table by combining the commodity and industry concepts in both the rows and columns of a quadratic table. The character of the columns then determines if the input coefficients describe a commodity technology (i.e. a commodity is assumed to have the same input structure in every industry in which it is produced) or an industry technology (i.e. the industry is assumed to have the same input structure whatever its product mix may be). The mathematics of these combinations will not be discussed here.¹⁹

The adoption of the 1968 System of National Accounts and the dominant role which the use matrix and establishments play in this system caused a shift in preference from the commodity concept, which in the past was considered to have a firmer theoretical basis in the input-output model, to the industry concept. This change in attitude can clearly be observed in the rules established for standardized tables for the region of the Economic Commission for Europe. In the 1959 and 1965 tables "the productive system has been classified into groups according to the kind of commodities produced and not according to the kind of the enterprise or another unit concerned".²⁰ In the 1970 and also 1975 tables, "the countries . . . were asked to construct their input-output tables on an industry-by-industry basis, but other forms were also acceptable".²¹ One can also find this in the United Nations input-output manuals. In the 1966

¹⁶"Establishment is the combination of activities and resources directed by a single owning or controlling entity towards the production of the most homogeneous collection of goods and services, usually in a single location but sometimes over a wider geographic area, for which separate data can be compiled in respect of the production and all the intermediate inputs, labour and capital resources employed for this purpose, directly and in support of, or ancillary to, the production" (A System of National Accounts (1968), *op. cit.*, p. 232).

¹⁷At a very early stage Statistics Canada began constructing rectangular input-output tables. See Statistique Canada, "La structure par entrées-sorties de l'économie canadienne 1961-1971" (Ottawa, 1977), or the publication of the first table of this set in Statistics Canada, "Input-output structure of the Canadian economy, 1961" (Ottawa, 1969).

manual the commodity tendency was considered "most desirable, even if it is seldom attained".²²

The user of a published input-output table will not always have sufficient information about the nature of the structural representation of the economy used. One can, however, assume that at higher aggregation levels—that is, in smaller tables—the differences in the disaggregation of total output will be less important than in more detailed input-output tables. Subsidiary products which appear in detailed classifications largely disappear with the aggregation of similar industries commodities.

The input-output tables included in this volume generally have similar taxonomies. In most tables data in the rows and columns are organized according to statistical units—that is, the tables are industry \times industry tables. The only exceptions are the tables for Haiti (1975), in which the commodity breakdowns are applied for columns and the table for India, in which the commodity breakdown is applied for rows. The quadratic table resembles the absorption matrix recommended in the 1968 System of National Accounts.

Valuation of transactions

Data in the national accounts (e.g. on private consumption, exports and imports) are most frequently valued at purchasers' prices (purchasers' values). The purchasers' value is "the cost of goods and services in the market to the point of delivery to the purchaser. It equals producers' values plus the trade and transport margins appropriate to the purchaser in question."²³

Other data and in particular data on production are valued at producers' prices. Producers' value can be defined either as the purchasers' value less trade and transportation margins or as the sum of values of direct inputs of primary production factors—that is, the value-added components consisting of wages, depreciation charges and operational surplus—plus the value of intermediate inputs and indirect taxes less subsidies.²⁴

Producers' prices were used in national accounts before the implementation of the 1968 System of National Accounts. The resulting price relations, however, are biased, since producers' prices include differences in taxes and subsidies for various products. The 1968 System made the necessary step towards uniform valuation by introducing the concept of basic values.

Basic values are producers' values less indirect commodity taxes. There are two types of basic values, the "true" and the "approximate" basic values. In true basic values, the intermediate inputs are net of indirect taxes. In approximate basic values, the indirect taxes other than commodity taxes are included in the valuation of the intermediate flows. Approximate basic values can be observed in the real world. True basic values are not observable and therefore must be calculated using a model. The input-output tables presented here were compiled in full accordance with the 1968 System of National Accounts and are all valued at approximate basic values. The relation between the three possible valuations of input-output tables is as follows. The approximate basic values are the "purest" kind of valuation. Approximate basic values plus commodity taxes give producers' values, which were until

²² *Problems of Input-Output Tables and Analysis* . . . p. 31.

²³ *A System of National Accounts* . . . p. 236.

²⁴ *Ibid.*

recently commonly used for the valuation of input-output tables. Producers' prices plus distribution margins give purchasers' prices, which can be used in the early stages of compilation of input-output tables but no longer appear in the published tables.

The valuation of import transactions is always consistent with the valuation of domestic flows. The measure corresponding to the producers' price is the customs clearance value, which is the c.i.f. value plus duties and taxes levied on imports. The measure corresponding to the approximate basic value is the c.i.f. value.

Input-output tables valued at purchasers' price were and are available at intermediate stages of input-output compilation, but are seldom published. Purchasers' prices are not considered to be well suited for the valuation of transactions in input-output tables. Trade and transportation margins depend not only on the producers but also on the purchasers of the goods or services. Purchasers' prices of identical goods or services therefore differ. The trade and transportation margins must be separated and treated as intermediate inputs of both distributive industries to other industries or as direct deliveries of distributive industries to final demand. It is sometimes recommended that transportation margins on products delivered to final demand should be accounted as intermediate inputs of transportation services to trade. If the costs of distribution are subtracted from the purchasers' values, one obtains the producers' prices.²⁵

The implementation of the 1968 System of National Accounts caused a shift from the valuation at producers' prices to the valuation at basic values, usually at approximate basic values. However, only the very recent input-output statistics for developed countries comply fully with the 1968 System. They provide two rectangular matrices valued at approximate basic values.²⁶

A different valuation of flows in the input-output tables influences the composition of value added. When tables are valued at producers' prices, value added includes indirect taxes. These are missing in tables valued at approximate basic values.

Input-output tables in this volume have a rather homogeneous valuation of transactions. Most are valued at producers' prices. The three exceptions are the table for Argentina (1970), valued at purchasers' prices (this table was not originally compiled, but is simply an updated 1963 input-output table), and the two tables valued at approximate basic values for Fiji (1972) and Singapore (1973).

The 1968 System of National Accounts also changed the concept of value added by industry by introducing the bank service charge. It is defined as an

²⁵The by-product of this separation—the matrix of distributive margins—is rarely published, although it provides an interesting source of information.

²⁶The implementation of the 1968 System of National Accounts valuation system was in most European countries supported by a change in the taxation system. The multi-phase turnover tax, which was levied on each (intermediate) transaction, was replaced by the value added tax, which is *de facto* a tax levied on private and public consumption (purchases of capital goods and exports are tax-free in most countries). Countries which introduced the value added tax apply in their input-output tables the net treatment of this tax. The value added tax invoiced by the producer is kept outside the production system. The balance between the supply and user side is obtained through a new supply item, which can be dealt with as a dummy industry called value added tax levied on production. Value added tax on final consumption of goods and services is accounted for at the bottom in a separate row (of commodity taxes). Import duties and taxes are treated in the same way. See *Standardized Input-Output Tables of ECE Countries for the Years around 1975* (United Nations publication, Sales No. E.82.II.E.24).

"imputed charge in respect of banking services equal, in practice, to the property income accruing to banks and similar financial institutions, over the interest accruing to depositors. In concept, the excess of property income of banks taken into account should be from investment of deposits only."²⁷ Bank service charges are, by definition, intermediate inputs. Since only their total value is known, it cannot be allocated to the individual industries purchasing these services. In input-output tables, they do not appear in intermediate consumption of bank services, but are simply included in gross value added. Their total must be subtracted from the sum of value added for all industries in order to arrive at the value of gross domestic product.

This treatment of imputed bank charges also affects the comparability of input-output tables, in particular the comparability of data on total intermediate inputs and on gross value-added by industries. It is possible to split the bank service charges by industries by an approximative method. This involves the addition of the estimated values of purchases by industries to the intermediate inputs from the banking industry and the subtraction of this total from gross output values of purchases by industries. This approximative method may differ among countries and does not improve the comparability of input-output tables.²⁸

In this volume the input-output tables for Nicaragua and for Singapore contain total imputed bank charges. In tables for other countries these are included in the row for the distribution of bank services.

C. Classification of activities in the input-output tables

Classifications in input-output tables are not determined by the methodology of national accounting, but are conceptually closely related. In national input-output tables, the decomposition of total output by industries or by commodities is usually based on internationally standardized classification systems.

The basis for the classification of industries is the International Standard Industrial Classification of All Economic Activities (ISIC), which was adopted by the United Nations in 1948 and revised in 1958²⁹ and 1968.³⁰ The ISIC is "a classification by kind of economic activity (or industry) and not by kind of occupation or commodity". The main criteria used in defining the ISIC system are characteristics of the activities of production units which determine the similarity in the production structure and experience of the producing units, and which involve the following: the character of the goods and services produced; the uses to which the goods and services are put; and the technology of the production process. On the basis of these criteria, the latest ISIC version is a four-level one (the levels being major divisions, divisions, major groups and groups).

²⁷*A System of National Accounts* . . . , p. 230.

²⁸In small countries with large banking sectors, total bank service charges can be high and are primarily accounted for by foreigners. The export bank services are not intermediate inputs of domestic industries. Their standard treatment erroneously reduces the value of gross domestic product and their splitting can create errors in gross value added by industry.

²⁹*International Standard Industrial Classification of All Economic Activities*, Statistical Papers, Series M, No. 4, Rev. 1 (United Nations publication, Sales No. 58.XVII.7).

³⁰*International Standard Industrial Classification of All Economic Activities*, Statistical Papers, Series M, No. 4, Rev. 2 (United Nations publication, Sales No. E.68.XVII.8).

The statistical unit of the ISIC classification is the establishment-type unit, which is also the main statistical unit of the System of National Accounts. The following statistical basis of classification may also be used: the kind-of-activity unit (for example, in the fields of construction, transportation and communication), which has no restriction in respect of the geographic area in which a given activity is carried out by a single legal entity; the ancillary unit, an example of which is a central administrative office; the technical unit, which is usually a part of an establishment and is engaged directly in the production of specific goods or services by the establishment; and finally the enterprise-type unit (business organizations and private non-profit institutions).

The character of the ISIC makes it compatible with the industry breakdown of the input-output table. The ISIC is also frequently used as the basis for national classification systems of economic activities, thereby creating conditions for international comparability of input-output tables. An identical breakdown of total output by industries in various countries is rare for the following reasons:

(a) Countries have adjusted their national classification systems to the international standard at different points in time. One can observe, in particular during the 1970s, a strong tendency towards greater uniformity between national classification systems with the adoption of the 1968 ISIC;

(b) The internationally agreed-upon ISIC was revised twice (1958, 1968). Tables compiled in earlier years are not comparable since they are based on different ISIC classifications;

(c) The present ISIC classification is not appropriate for the structure of developing economies in which agriculture is the dominant sector.³¹ The 1968 ISIC disaggregation of the agricultural sector has a weak theoretical basis.

The comparability of classifications can easily be seen in detailed national input-output tables. In aggregated tables problems of comparability seemingly disappeared. Broadly defined industries, however, can have different output mixes. A common name of an industry can hide profound differences in the nature of the product and in the production technology; an example is the chemical industry which includes the production of both fertilizers and pharmaceuticals.

Contrary to the industry decomposition, there is no agreed international standard for the commodity decomposition of total output. The commodity classifications in input-output tables are based on characteristic products of industries in the activity classifications, but can also cover classification systems used in foreign trade statistics.

In foreign trade statistics, there exist three international classification standards. Two are applied by users of the System of National Accounts and the other one by centrally planned economies.³² Among the first group, the

³¹Major Division 1 is divided into only seven activities: 1110 Agricultural and livestock production; 1120 Agricultural services; 1130 Hunting, trapping and game propagation; 1210 Forestry; 1220 Logging; 1301 Ocean and coastal fishing; 1302 Fishing not elsewhere classified. In input-output tables for developing countries agriculture is often broken down in far greater detail. Such breakdowns usually have a commodity character.

³²The member countries of the Council for Mutual Economic Assistance use their own Standard Foreign Trade Classification (SFTC) System. It can be reclassified into the SITC System. See *Correspondence Table between the Standard International Trade Classification of the United Nations (SITC) and the Standard Foreign Trade Classification of the Council for Mutual Economic Assistance (SFTC)*, Statistical Standards and Studies, No. 32 (United Nations publication, Sales No. E/R.82.II.E.10).

more frequently used classification system is the Standard International Trade Classification (SITC).³³ It was adopted in July 1950 by the United Nations and revised in 1960 and 1975. The revised versions of the SITC taken into account are based on the other international system, the Customs Tariff Nomenclature adopted in 1955 by the Customs Co-operation Council. The foreign trade nomenclatures do not include exports and imports of services, for which no unified classification system exists.

The foreign trade nomenclatures are seldom used as a basis for the commodity breakdown of input-output tables, but they can indirectly influence their comparability. Data on foreign trade are available according to either the SITC, the Customs Tariff Nomenclature or national nomenclatures. The data must be reclassified into the industry breakdown in order to obtain information on total resources (i.e. domestic output plus imports) and on exports by industries. Exact correspondence between the SITC or the Customs Tariff Nomenclature, on the one hand, and the ISIC, on the other, can only be achieved at a very low level of disaggregation.³⁴ If this is not possible, reclassification errors reduce the comparability of input-output tables. Finally, differences in the commodity mix of groups bearing the same name create problems similar to those arising from differences in the output mix of identically defined ISIC industries.

Classifications of input-output tables included in this volume conform closely to the latest 1968 version of the ISIC. They differ, however, in the degree of disaggregation. The table for Rwanda is very small (11 industries),³⁵ but this is not surprising if one considers the difficulties facing the statistical services of such a developing country. A few tables are relatively large, such as those for China (Taiwan Province) (1971, 1974), Indonesia and Singapore, which contain 75, 64, 60 and 65 industries, respectively. The size of the remaining 9 tables ranges from 19 to 45 industries.

D. Standardization of input-output tables

No attempt was made to standardize tables included in this volume into a unified framework. Standardization would be possible only if the tables did not differ methodologically. Such an exercise would require close co-operation with national statistical offices (mainly in aggregating or disaggregating activities in

³³*Standard International Trade Classification*, Statistical Papers, Series M, No. 10 (United Nations publication, Sales No. 51.XVII.1).

³⁴*Classification of Commodities by Industrial Origin*, Statistical Papers, Series M, No. 43, Rev. 1 (United Nations publication, Sales No. 71.XVII.15).

³⁵One of these industries is called 'non-market goods'. Similar items can also be found in input-output tables for a few other developing countries. In these economies the division of labour and the monetary exchange are weak in rural areas and a substantial part of the output is produced for own use or for barter exchange on local markets. These non-monetary transactions should be also considered in input-output tables. A good solution of this problem can be found in the input-output tables for Kenya for 1967 and 1971. These tables contain two rows and two columns of activities in the non-monetary sector, i.e. for agriculture, fishing and forestry, on the one hand, and for water supply, building and ownership of huts, on the other. These activities also exist in the monetary sector. The non-monetary and monetary activities differ in the structure of inputs and in the direction of transactions. The non-monetary sector purchases from, but does not sell to, the monetary sector. See *Input-Output Tables for Kenya, 1967* (Nairobi, Central Bureau of Statistics, Ministry of Finance and Planning, 1972), and *Input-Output Tables for Kenya* (Nairobi, Central Bureau of Statistics, Ministry of Finance and Planning, 1976).

national systems into a common classification system). UNIDO does not have, at present, resources which would allow it to engage in such far-reaching co-operation with statistical services of a number of developing countries. As discussed above, the tables differ in several important methodological aspects, including the handling of imports, valuation, the breakdown of total output, the existence of unallocated transactions and separate accounting of imputed bank charges.

Although no attempt was made to standardize the input-output tables included in this volume (and no such activity on a large scale is planned by UNIDO), it may be of some interest briefly to consider possible approaches to this problem and to review past efforts at standardization.

Standardization of input-output tables was first accomplished by two international organizations in Europe. Their example has hitherto not been followed by other international bodies. A few research and university institutes have created private sets of unified input-output tables which they have used as a data base for comparative studies.³⁶ The two international organizations involved were the Statistical Office of the European Communities³⁷ and the United Nations Economic Commission for Europe.³⁸ Their approaches to the compilation of standardized input-output tables were different because of their institutional character. The Statistical Office of the European Communities was able to agree with the statistical services of its member countries on a common input-output methodology. The uniformity of the final products was thus secured from the very beginning of the data compilation, since a common methodology and country classification system was established *ex ante*. The main tables for member countries of the European Communities were compiled on the basis of an identical reference year.

For the first two sets of standardized input-output tables, the EEC had to rely on available data, much of which had already been published. Serious problems arose due to the differences in the methods of compilation, industry classifications, pricing systems and reference years employed by the participating countries. Time lags between the reference years of the input-output tables and the years of publication of the standardized sets were large. The United Nations Economic Commission for Europe also included standardized input-output tables for its non-European member countries (Canada and the United States of America) and for Japan. In the preparation of the two most recent sets of standardized tables for the years around 1970 and 1975, the statistical offices of most countries co-operated and submitted data based on a standardized questionnaire.

The great effort which was put into this vast statistical work contrasts with the limited use made of the standardized input-output tables. At a very early stage of its input-output project, the Secretariat of the United Nations Economic Commission for Europe undertook several comparative studies in

³⁶For example, Bradford University in the United Kingdom, Hamburg University in the Federal Republic of Germany, and the German Institute for Economic Research in Berlin (West).

³⁷The work was started in 1962 as a follow-up to the 1961 International Conference on Input-Output Techniques in Geneva. See H. Schumacher, "Das *Input-Output* System des Statistischen Amtes der Europäischen Gemeinschaften", in *Statistical Information*, No. 2 (Luxembourg, Eurostat, 1964), pp. 13-36.

³⁸The work was started in 1967. See "Summary reports on standardized input-output tables", *Input-Output Techniques*, A. Brody and A. P. Carter, eds. (Amsterdam, North Holland Publishing, 1972), pp. 583-600.

co-operation with research institutes of several member countries,³⁹ and a comparative study was carried out.⁴⁰ The results were published; however, little use was made of them by the Commission. A major obstacle was the large time difference between the reference years of the tables and the years of their publication (except for the last set of tables for years around 1975). UNIDO has made use of the recent tables in the construction of regional input matrices. Only in recent years have these tables found an important application as the basis for a set of unified energy input-output models⁴¹ for the member countries. The input-output tables of the European Communities were, no doubt, an important tool for the unification of statistics in the member countries.

CHINA (TAIWAN PROVINCE) (1971)

Reference year: 1971

Entries in table: Domestic flows

Source: Overall Planning Department, Economic Planning Council, "Taiwan Input-Output Tables 1971", Taipei 1974

Computerized: Deutsches Institut für Wirtschaftsforschung, Berlin

Currency units: Taiwan dollars

Scale factor: 1,000,000

Pricing system: Producers' prices

Intermediate sectors (rows × columns): 76 × 76

Treatment of imports: Intermediate imports row 78

Availability of import matrix: Not available

Total number of rows: 90

Statistical unit of quadrant 1: Industry

Total number of columns: 86

Statistical unit of quadrant 1: Industry

Fourth quadrant: Not occupied

EGYPT

Reference year: 1973

Entries in table: Domestic flows

Source: Central Agency for Public Mobilization and Statistics, Cairo

Computerized: Economic University of Vienna, Austria

Currency units: Egyptian pounds of the year 1973

Scale factor: 100,000

Pricing system: Producers' prices

Intermediate sectors (rows × columns): 24 × 24

Treatment of imports: Row 33

Availability of import matrix: Not available

Total number of rows: 34

Statistical unit of quadrant 1: Industry

Total number of columns: 34

Statistical unit of quadrant 1: Industry

Fourth quadrant: Occupied

MOROCCO

Reference year: 1975

Entries in table: Total flows

Source: (Direct communication)

Computerized: Economic University of Vienna, Austria

Currency units: Moroccan dirhams of the year 1975

Scale factor: 1,000,000

Pricing system: Producers' prices

Intermediate sectors (rows × columns): 33 × 34

Treatment of imports: Rows 42-45

Availability of import matrix: Not available

Total number of rows: 46

Statistical unit of quadrant 1: Industry

Total number of columns: 43

Statistical unit of quadrant 1: Industry

Fourth quadrant: Not occupied

Notes: Unsymmetric first quadrant because of column 34 (Imputed bank service charges)

NICARAGUA

Reference year: 1974

Entries in table: Domestic flows

Source: Banco Central de Nicaragua, Managua, "Matriz de insumo-producto de Nicaragua 1974", Managua, D.N., February 1979

Computerized: UNIDO/IS/GLO

Currency units: Córdobas of the year 1974

Scale factor: 1,000,000

Pricing system: Producers' prices

Intermediate sectors (rows × columns): 38 × 39

Treatment of imports: Intermediate import rows 40-42

Availability of import matrix: Not available

Total number of rows: 49

Statistical unit of quadrant 1: Industry

Total number of columns: 48

Statistical unit of quadrant 1: Industry

Fourth quadrant: Occupied

Notes: Unsymmetric first quadrant because of column 37 (Adjustment for financing services)

UNITED REPUBLIC OF TANZANIA (MAINLAND)

Reference year: 1970

Entries in table: Domestic flows

Source: United Nations Development Programme, DP/UN/URT-68-005/1, Statistics (National Accounts), "Tanzania, Projects Findings and Recommendations", United Nations, New York, 1975

Computerized: UNIDO/IS/GLO

Currency units: Tanzanian shillings of the year 1970

Scale factor: 1,000,000

Pricing system: Producers' prices

Intermediate sectors (rows × columns): 45 × 45

Treatment of imports: Intermediate import rows 47-49

Availability of import matrix: Not available

Total number of rows: 57

Statistical unit of quadrant 1: Industry

Total number of columns: 53

Statistical unit of quadrant 1: Industry

Fourth quadrant: Occupied

ABSTRACT

The introduction to volume II of *Input-Output Tables for Developing Countries* deals with different aspects of and problems related to the comparability of international input-output tables. Thus it raises and explains the major problems which the user might face when applying the published tables.

The second volume of the publication of input-output statistics contains 16 input-output tables for 15 developing countries and areas. The reference years of these tables fall into the 1970s. Tables included in the volume are to a large degree not comparable. The main obstacle to comparability is the different treatment of imports. Some tables contain a full import transaction matrix, while some contain no information on the pattern of allocation of imports. However, most contain a row with data on total imported inputs by industries and final demand components. Other obstacles to comparability are unallocated inputs and outputs, which occur quite frequently, and different breakdowns by industries. No attempt was made to standardize the industry classifications of the tables. Tables included in the set are rather homogeneous from two other important points of view. Almost all are valued at producers' prices (and not at purchasers' prices or approximate basic values) and the rows and columns of most tables represent industries and not commodity groups.

SOMMAIRE

L'introduction du volume II des *Tableaux entrées-sorties des pays en développement* traite divers aspects de ces tableaux et certains problèmes posés par leur comparabilité sur le plan international. Elle dégage et explique ainsi les principales difficultés que l'utilisateur peut rencontrer dans l'exploitation des tableaux publiés.

Le deuxième volume de la publication consacrée aux statistiques des entrées-sorties contient, pour 15 pays en développement et régions, 16 tableaux entrées-sorties dont les années de référence se situent entre 1971 et 1980. Dans une large mesure, les tableaux présentés dans cet ouvrage ne sont pas comparables du fait essentiellement du traitement différent des importations. En effet, si ces tableaux comprennent pour la plupart une ligne où figurent des données sur le total des entrées importées par branche d'activité marchande et éléments de la demande finale, certains d'entre eux contiennent une matrice complète des opérations relatives aux importations et d'autres encore ne fournissent aucun renseignement sur le mode de répartition des importations. Au nombre des autres difficultés qui s'opposent à une comparaison, il faut citer la non-répartition — fort fréquente — des entrées et des sorties ou encore les différences de ventilation par branche d'activité. On n'a pas essayé de normaliser les classifications des branches d'activité utilisées dans les tableaux. Ceux-ci sont assez homogènes dans deux autres domaines importants : d'une part, ils sont pour la plupart établis en prix départ usine (et non prix d'acquisition ou valeurs de base approchées), et, d'autre part, leurs lignes et colonnes correspondent dans la plupart des cas à des branches d'activité et non à des groupes de biens et services marchands.

EXTRACTO

En la introducción al Volumen II de los *Cuadros de Insumo-Producto para los Países en Desarrollo* se tratan los distintos aspectos de la comparabilidad de los cuadros internacionales de insumo-producto y los problemas conexos. De este modo, se plantean y explican los principales problemas con que puede encontrarse el usuario al aplicar los cuadros.

El segundo volumen de la publicación sobre estadísticas de insumo-producto contiene 16 cuadros de insumo-producto correspondientes a 15 países y áreas en desarrollo. Los años de referencia de esos cuadros entran dentro del decenio de 1970. En gran medida, los cuadros que figuran en ese volumen no son comparables. El principal obstáculo que se opone a su comparabilidad es la distinta forma de tratar las importaciones. Algunos cuadros contienen una matriz completa de las transacciones relativas a las importaciones, algunos no contienen información alguna sobre la estructura de la asignación de las importaciones, aunque la mayoría contenga una línea con datos sobre el total de los insumos importados por industrias y componentes de la demanda final. Otras dificultades para la comparabilidad son los insumos y productos no asignados, que se dan con gran frecuencia, y las diferencias en los desgloses por industrias. No se hizo ningún intento de normalizar las clasificaciones de los cuadros por industrias. Los cuadros que figuran en esta serie son bastante homogéneos desde otros importantes puntos de vista. Casi todos están valorados a precios de producción (y no a precios de compra o valores básicos aproximados) y las líneas y columnas de la mayoría de los cuadros representan industrias y no grupos de productos básicos.

كيفية الحصول على منشورات الأمم المتحدة

يمكن الحصول على منشورات الأمم المتحدة من المكتبات ودور الوزيع في جميع أنحاء العالم - استلم منها من المكتبة التي تتعامل معها
أو اكتب إلى : الأمم المتحدة، قسم البيع في نيويورك أو في جنيف .

如何购取联合国出版物

联合国出版物在全世界各地的书店和经销处均有发售。请向书店询问或写信到纽约或日内瓦的联合国销售组。

HOW TO OBTAIN UNITED NATIONS PUBLICATIONS

United Nations publications may be obtained from bookstores and distributors throughout the world. Consult your bookstore or write to: United Nations, Sales Section, New York or Geneva.

COMMENT SE PROCURER LES PUBLICATIONS DES NATIONS UNIES

Les publications des Nations Unies sont en vente dans les librairies et les agences dépositaires du monde entier. Informez-vous auprès de votre libraire ou adressez-vous à : Nations Unies, Section des ventes, New York ou Genève.

КАК ПОЛУЧИТЬ ИЗДАНИЯ ОРГАНИЗАЦИИ ОБЪЕДИНЕННЫХ НАЦИЙ

Издания Организации Объединенных Наций можно купить в книжных магазинах и агентствах во всех районах мира. Наводите справки об изданиях в вашем книжном магазине или пишите по адресу : Организация Объединенных Наций, Секция по продаже изданий, Нью-Йорк или Женева.

COMO CONSEGUIR PUBLICACIONES DE LAS NACIONES UNIDAS

Las publicaciones de las Naciones Unidas están en venta en librerías y casas distribuidoras en todas partes del mundo. Consulte a su librero o diríjase a: Naciones Unidas, Sección de Ventas, Nueva York o Ginebra.
