## I. EXECUTIVE SUMMARY

The project was initiated by the Niger/Nigeria Joint Commission for Co-operation with the headquarters located in Niamey, Boulevard des Ambassades, Republic of Niger.

The field research in Niger and Nigeria for the prefeasibility study took place during the period April 17 - June 2, 1983. The research team was composed of three Polish specialists: Mr J.Bania (plant technologist), Mr L.Czarcinski (team leader, and Mr R.Gajecski (economist).

The project may be defined as being primarily market oriented but also combines the possibility of appreciation of the local raw-materials basis. In major portion of yearly raw-materials requirements, the glass plant may use local resources. The market research done at the beginning of 1983 proved an existence of the market size in Niger and Northern Nigeria for beer and soft drink bottles, which justifies the construction of the glass plant with production capacity of 60000 t/y.

There is no production of glass in Niger. The existing glass containers production capacity in Nigeria, estimated to be 210,000 t/y in 1983, does not meet present and potential (future) demand.

The market share of Niger is only about 3.5 % of the total combined Niger and Northern Nigeria market. This means that the location of the plant in Niger is possible only under the assumption that a majority of production would be sold in Nigeria market.

In both: Niger and Northern Nigeria, the geological research has not resulted as yet, in sufficiently documented raw-materials deposits for production purposes. Different preliminary evaluations, done so far in both countries, of basic raw-materials resources such as glass sand, limestone, and dolomite, indicate a potential success in searching for necessary deposits.

The conditions of electrical energy and water supply for production purposes seem to be comparable in both countries. Production has to be supported by inside plant generating systems.

Utilities such as heavy and light oil, Diesel oil and LPG are locally available in Nigeria from local production, while Niger must still import oil products.

Based upon the analysis of market structure and potential raw-materials deposits, the two alternative locations of the plant may be considered at the pre-feasibility stage: in Niger - the region of Maradi, and in Nigeria - the Kano State territory. An appropriate, concrete Plant location may be determined after the completion of geological surveys of glass sand deposits.

The plant is supposed to produce 60000 tons of glass or 137,134 million of beer and soft drink bottles per annum. It is going to have two tank furnaces, each equipped with 3 automatic forming machines IS 6 DG (six section double bob). One tank furnace will produce continuously flint glass, while the second coloured glass.

The glass plant has to operate continuously during the whole period of tank furnace campaign based upon three

shifts system. The plant operation needs the total employment of 445 persons.

The minimum permanent foreign assistance is assumed to be 3 persons and should be recommended by technical partner.

The project is supposed to be a joint venture in both countries: Niger and Nigeria.

The major components of the Plant overhead costs are management and administration, foreign assistance and the tank furnaces maintenance. The proportion of overheads in operating costs is in Niger 8.72 % and in Nigeria 14.53 %.

The construction period is assumed to be 2.5 years or 3 years including 6 months of implementation planning.

The construction period ends up with the completion of cold start up of machinery and equipment and of heating up of tank furnaces. The above assumption implies the production program to be 76.5 % of full capacity during the first and one start-up year.

Financial and economic evaluation permitted to develop the major characteristics of the project in Niger and Northern Nigeria.

- Total investment costs

- a) Niger (in CFA) 32,637,683,000 or (in US \$) 81,719,207
- b) Nigeria (in Naira) 61,705,400 or (in US \$) 20,217,020

at the exchange rate 400 CFA equals 1 US \$ and 1.5 US \$ equals 1 Naira.

- Equity participation in total investment is assumed to be 30 %, while technical partner participation in equity to be limited to 20 %.

The amount of loans needed to finance the project is:

- in Niger 22,683,000,000 CFA, or 56,720,000 US \$

- in Nigeria 43,705,421 Naira, or 56,317,047 US \$

The parameters of the financial project evaluation, calculated for the two locations of the Plant in Niger and Nigeria, are as follows:

	<u>Niger</u>	<u>Nigeria</u>
Internal rate of return (IRR)	12.73 %	14.146 %
Pay-back period - years	5.7	5.0
Rentability of capital	11.65 %	16.14 %
Rentability of investment	3.66 %	4.38 %
Job creation, specific.		
capital requirement	185,928 \$/job	182,510 \$/job
Simple rate of return	11.62 %	16.24 %

The above shown values of project parameters should be perceived as rather pessimistic as they were developed based upon pessimistic assumptions concerning product price and also production cost.

The calculation does not include an inflation factor.

The inclusion of inflation would result in more optimistic values of the project parameters.

With regard to an inflation rate of 12 % per annum, the project seems to be an interesting investment opportunity in both countries. This situation makes the choice of final location of the plant difficult. It should be emphasized, that a full-blaged feasibility study can be prepared only when the promoter of the project is fully identified and the decision on the exact location is taken by the relevant authorities.

The present pre-feasibility study has been prepared in order

to supply the appropriate information for the decision makers to make a final selection of the location of the factory. We think, that such selection should be possible when geological survey of glass sand, limestone and dolomite deposits in Maradi region and on the Kano State territory is available. At the present stage of the study the following general conclusion can be drawn: under the assumption of equal raw-materials opportunities in Niger and in Nigeria, the location of the plant in Nigeria would require less effort to make the project economically successful.

## II. PROJECT BACKGROUND

The development of glass production in Africa may be considered as relatively advanced in relation to other industries. The market for glass containers and also for flat glass has been increasing, while the existing production does not follow up the development of demand. This situation inspires African countries to promote efforts towards an acceleration of the glass production development. The following traces of such efforts had been found during the UNIDO mission to Niger and Nigeria.

### Nigeria

One of the first investigations concerning the glass production in Nigeria was done by Arthur W. Schmidt International Inc. in 1959<sup>1)</sup>. The study was mainly devoted to the analysis of availability of raw materials for glass production in Nigeria. A number of locations were indicated for different raw materials such as: sand, limestone, dolomite and feldspar. Since that time the glass production has grown rapidly. At present four glass plants are in operation in Nigeria:

- Nital Box Toyo Glass Ltd. (3 furnaces) in Asaba,  
Ogun State
- Delta Glass Co. Ltd. (2 furnaces) in Ughelli, Bendel State

---

1) Investigation of the feasibility of glass production  
in Nigeria, Arthur W. Schmidt International Inc.  
Report No. 10023, December, 1959. Report submitted to  
Universal New York, Inc. Empire State Building, New  
York, N.Y.

- West African Glass Co.Ltd. /1 furnace/ in Port Harcourt, River State
  - Ballarpur Nigeria Ltd. /1 furnace/ in Kaduna, Kaduna State,
- and one still under construction :
- International Glass Co. Ltd. /1 furnace/ in Aba, Imo State.

The most recent feasibility study of glass production made for Nigeria by Investment Information and Promotion Centre of the Federal Ministry of Industries in 1982 indicates still growing market potential and opportunities for this type of production in the country. Within the Fourth National Development Plan 1981-85 glass production projects have been considered in States : Ondo, Ogun, Lagos, Anambra, Borno, Plateau, Kano, and Bauchi<sup>1/</sup>. The Kano State Government has also shown strong interest in building the glass plant. The glass bottles production has been stimulated by new and expansion projects of existing beer and soft drinks production<sup>2/</sup>. The actual production of glass bottles does not meet demand<sup>3/</sup>. The present study focuses attention on satisfaction of needs within two joint markets : Northern Nigeria and Niger. The study takes in this way into consideration an economic integration potential existing between Nigeria /English spoken/ and Niger /French spoken/ countries.

2/ ibid, p. 165-166.

3/ The Seven-up Co. Ltd. imports most of bottles.

Niger

Niger with her approximately 6 millions population represents, in relation to Nigeria, much smaller market potential for glass containers production. Within the zone of French countries Ivory Coast was first to take initiative in promoting glass production. After the Lome Convention, the Centre de Developpement Industrielle (CDI) of CEMAC countries undertook the prefeasibility study of glass production in 1978 for three countries: Ivory Coast, Upper Volta and Niger. The study was verified by Brasseries + Glacières Internationales (BGI) in Paris for the conditions of Niger and positive recommendation was formulated to build the plant in Niger with the capacity of 20 000 t/A and equity composed of contributions of Niger, Upper Volta, Ivory Coast and BGI. No cooperation or link with the Northern Nigeria market was assumed within this study.

The Nigeria/Niger Joint Commission has been in possession of a document concerning an investigation of glass production for Niger and Nigeria. However, the document is limited to the analysis of the Niger market and respective raw material basis with recommendation to make a comparative analysis in Nigeria. In this respect the present study is a logical follow up of the previously made research.

The present study assumes the possibility of Niger - Nigeria economic integration. This means that the joint: Niger + Northern Nigeria market potential serves as a basis for the determination of the plant capacity.

The projected capacity exceeds the demand in Niger only and probably in all ECAO countries<sup>1)</sup>.

Therefore, the location of the plant in Niger may be considered only under the assumption that most of production will be sold in the Nigerian and other ECAO markets.

It has also to be assumed that the project would be a joint venture, as the amount of investment to be made exceeds probably the possibilities of Niger only.

---

1) Niger and other ECAO countries have expanded projects of drinks, transformation of tomato and vegetables and other fruits. This will of course increase demand for glass containers.

### III. MARKET AND PLANT CAPACITY

#### 1. The Geographical Scope of the Investigation.

The object of this investigation is the demand for glass containers in Niger and Northern Nigeria. Niger covers an area of 1,267,000 km<sup>2</sup> and has reached a population of 5.845 million in 1982. Nigeria, covering an area of 923,800 km<sup>2</sup> has an estimated population of 90.0 million.

The northern part of the country embodies 10 states: Sokoto, Kano, Borno, Niger, Kaduna, Bauchi, Gongola, Kwara, Plateau and Benue and the territory of the federal capital. The so-described Northern Nigeria accounts for 730,885 thousand km<sup>2</sup> of area or 79.1 % of the whole territory. The estimated population of this area reached 47.53 million in 1982, representing 52.3 % of the whole population.

The above facts show that there is a distinguishable concentration of economic activity in the South. This regards also the beverages and existing glass containers production.

#### 2. The Product Definition.

Glass Containers cover a wide range of products used as packages. An introductory market analysis has restricted the investigation to the demand for bottles for two kinds of beverages: beer and soft drinks. Bottles of similar type are used in both countries:

- for beer: volumes of 0.33 l, 0.6 l, 0.66 l;
- for soft drinks: volumes of 0.29 - 0.33 l.

The coloring of the bottles is: white, green and amber.

Beside a visible expansion of beverages production in the last years (in Nigeria in particular), both countries aim at a diversification of the production, including food-processing. This indicates a growth of demand for containers other than bottles, such as jars, glass balloons, phials and others, in the future. In comparing with the demand for beer and soft drinks bottles it is negligible at present and will probably remain so in the near future. According to the bottles (Nigeria) and beverages producers practically all circulating bottles return and the demand for new ones is due to:

- growth of beverages production,
- technological loss at filling up bottles,
- distribution loss.

Returnable bottles are substituted by non-returnable ones and metallic cans. At present 4 % at the most of the produced beverages are sold in cans. A small rise of this share is possible (in Nigeria in particular) due to the market penetration of areas away from towns, the bush in particular. A growth in demand for returnable bottles is also possible, but not before the end of 1984.

These potential new facts do not shake the leading business of returnable bottles used as beer and soft drinks containers neither at present nor in the future.

### 3. The Market in Niger and Northern Nigeria

#### 3.1. Method of Investigation.

Two separate methods of investigation have been chosen for Niger and Nigeria, taking account of the distinction between them in regard of:

- general level of social and economic development,
- beverages and bottles consumption and production,
- organization of information and statistics services.

Niger has no glassware production as yet and all her demand is satisfied by means of import. The sole beer and soft drinks producer is Braniger in Niamey and Maradi.

An accurate estimate for the demand was therefore possible relying on direct interviews in plants.

Nigeria has a large number of beverages producers. The market analysis began by analyzing data on production and production capacity from the Federal Ministry of Industry and Trade. However, these were found to be non-reliable and direct interviews together with consultations with a dozen of leading home producers were carried out. A similar procedure was applied for estimating the present and potential production of glass containers in the existing glass-works in the country.

It is important to underline that the latest statistical yearbooks in both countries include information ending on 1979.

The up-dating of the main time series required research and verification of many sources, and also interviewing the producers.

Time series describing the growth of production and beverages consumption per capita were applied to predict future bottles demand. Hence an indirect method of estimating the bottles demand was used deriving from the beverages consumption predictions.

Two preliminary variants of estimation were elaborated.

The first one used the regression analysis, whereas the second was based upon the assumption that the demand will grow at a constant yearly rate lower than the one observed in the past.

The first variant assumed reliability of statistical data before 1970 obtained from official sources in Nigeria.

The second one allowed underestimation of statistics in the past, resulting in overestimating the empirical growth rate of beverages consumption in the investigated period ending in 1982/83.

The second variant, as more reliable, has been used as origin for estimating the bottles demand including specifics of the bottle market and taking appropriate parameter assumptions.

### 3.2. The Market in Niger.

#### 3.2.1. Imports of bottles.

The following data on imports of glassware come from three sources:

- OPEN (Office de Promotion de l'Entreprise Nigérienne)
- Direction de la Statistique et de Comptes Nationaux,
- Banque de Niamey.

Table 1

Imports of Glassware to Niger in the Years

1979-1981 (OPEN)

Name of Article and its Origin	Unit of Measure	1979	1980	1981

Table 2

Import of Ordinary Glass Bottles and Jars in Côte  
d'Ivoire - 1981

/Direction de la Statistique et de la Cartographie/

quantities in tonnes, value in millions CFA

Name of Article	1978		1979		1980		1981	
	quantity	value	quantity	value	quantity	value	quantity	value
Ordinary								
Glass	246.87	17.382	942.47	107.556	1026.78	1130.299	653.88	181.755
Bottles								
Ordinary								
Glass	-	-	20.020	4.204	8.318	4.370	15.439	3.634
Jars								
Total	246.87	17.382	962.569	141.050	1035.098	135.169	674.319	185.389

Table 3

Number of Bottles bought in the years 1980-1983

(Braniger de Liracay top three with Lirac)

Unit of Measure	1980	1981	1982	1983	1984 <sup>x</sup>
Number of tonnes of Bottles	630.0	920.0	757.0	695.0	634.0
Number of Bottles in millions	1.565	2.300	1.810	1.690	1.550

x) - estimates of the Braniger management

It is hard to derive explicit and exact conclusions from the above. The OPEN statistics are as much erroneous as informations of the Bureau of Statistics. Data in Table 3 concern the bottles demand of the leading producer, but alone.

However, there is no doubt that ordinary glass bottles dominated the imports of glassware to Niger in the years 1972 - 1981.

#### 3.2.2. Demand for Beverages in Niger.

The estimation of the demand was derived from the refreshing drinks market development up to the present. Both imports and exports are negligible and therefore the internal production sold has been used to determine the consumption. Table 4 illustrates essential data.

Time series from Table 4 have been used to estimate econometric models for development trends in beer and soft drinks consumption per capita, and from there a preliminary future demand for beverages has been predicted. Such procedure seems to be more accurate than the demand estimation based on existing beverages producing plants output capacity.

At present (1983) these are exploited in 63 % in beer and 67 % in soft drinks in Niger.

There is also a possibility of including social and economic factors and facts in our predictions, having influence on the level of beverages consumption.

From many estimated econometric models for development trends in beverages consumption per capita,

Table 4

Beer and Soft drinks Consumption development  
in Niger in the years 1974 - 1983

Years	Home Production in millions of litres		Population	Consumption per capita in litres	
	Beer	Soft Drinks		Beer	Soft Drinks
1974	4.10	2.43	4.707	0.87	0.52
1975	4.26	2.63	4.857	0.83	0.55
1976	4.54	3.02	4.971	0.91	0.61
1977	5.43	3.66	5.098	1.07	0.76

1982	9.60	9.39	5.845	1.64	1.69
1983	9.50 <sup>x</sup>	10.00	6.007	1.58	1.66

x - Estimated by Braniger de Niamey

Sources: Braniger de Niamey, Annuaire Statistique  
 1978 - 1979 du Niger

the ones satisfying all statistical requirements have been chosen.

Model of Beer Consumption per Capita ( $Y_1$ )  
per Year in Litres

$$Y_1 = 0.09697t + 0.72467$$

(10.8026) (13.1073)

$$R^2 = 0.9367, s = 0.0809, r_1 = 0.2565, D = 1.2715$$

t for time, 1974 has been taken as t = 1.

$R^2$  - determination coefficient,

s - standard deviation,

$r_1$  - autocorrelation coefficient of order 1,

D - Durbin - Watson statistic

number inside the brackets denote the t-Student statistics.

The exponential model as well as generalized exponential models have been found to be worse than the above.

Model of Soft Drinks Consumption  $Y_2$   
per Year in Litres

$$0.141626 t - 0.835192$$

(16.0571) (15.2610)

$$Y_2 = e$$

$$R^2 = 0.9699, s_{ln} = 0.0801, r_{1ln} = -0.2452,$$

$$D = 2.3183$$

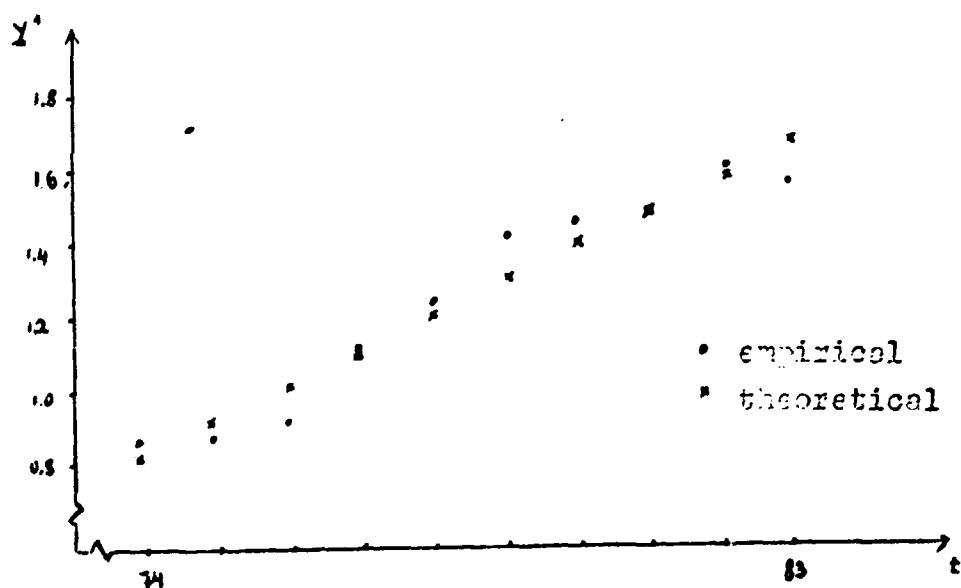

Satisfactory results from the point of view of prediction requirements have been obtained also in the linear model :

$$Y_2^* = 0.158405 t + 0.265533$$

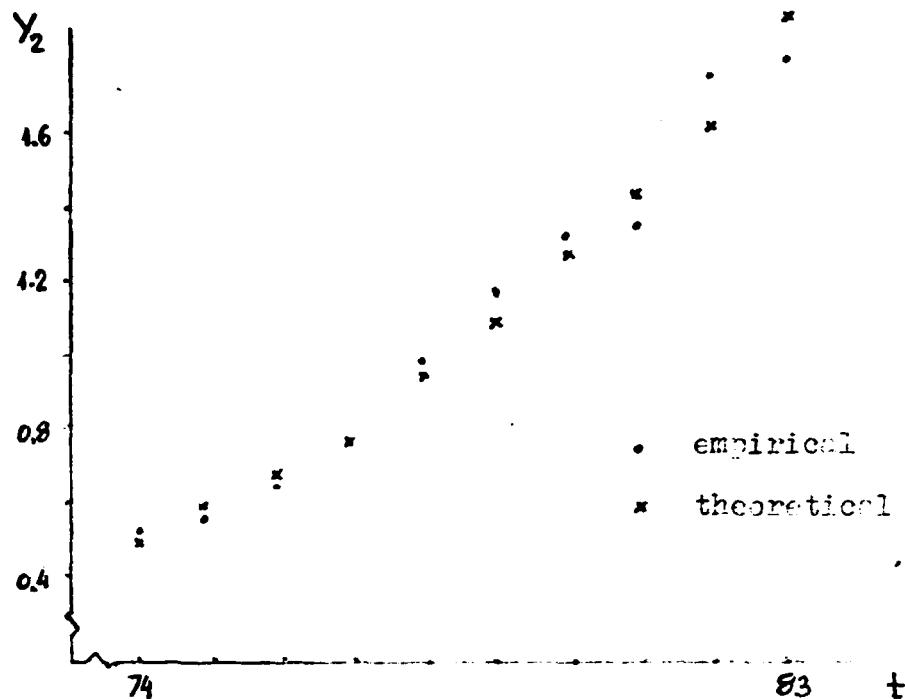

$$/12.1445 / 3.7501 /$$

$$R^2 = 0.9405, s = 0.1036, r_1 = -0.3214, D = 2.43;$$

$s_{ln}$  and  $r_{1ln}$  indicate values of the standard deviation and autocorrelation coefficient of order 1 according to, calculated from  $\ln Y_2$  and  $t$ . Models  $Y_1$ ,  $Y_2$  and  $Y_3$  have been evaluated naturally by means of a computer and the classical method of least squares. Figures 1 and 2 show real and theoretical values calculated from the  $Y_1$  and  $Y_2$  models accordingly.

Picture 1. Empirical and Theoretical Beer Consumption per Capita in Niger in the Years 1974-1983.

Picture 2. Empirical and Theoretical Soft Drinks Consumption in Niger in the Years 1971-1983.

Based upon empirical observations and the evaluated models a mean yearly rate in consumption per capita in the investigated period has been estimated. It has reached the value of  $r = 3.37\%$  for beer and  $r = 13.99\%$  for soft drinks.

The so-observed rate is quite high and will be hard to keep in the near future, in spite of the still low absolute level of consumption per capita, compared with Nigeria for example.

The general social and economic situation in Niger and its perspectives suggest a sceptical view. However, a considerably high regularity and a visible evolutionary nature of the beverages consumption development have to be noted, justifying the application of a similar

rate for the future period.

Rows 3 and 4 in Table 5 show the estimated beer consumption per capita based upon two different assumptions.

Row 4 in Table 5 shows the estimated beer consumption under a pessimistic assumption of a drop in growth rate of the consumption per capita to 60 % of its all years mean value in 1974 - 1983.

The estimations were based on the consumption in 1983 and a consumption growth rate of 8 % per year in total (2.77 % mean population growth per year + 5.23 % mean consumption per capita per year).

Table 6 shows the estimated consumption of soft drinks taking similar assumptions in row 3 and 4 as in Table 5.

The observed mean growth rate of consumption per capita of 13.39 % per year in 1974 - 1983 has been lowered to 8.23 %, and put together with a population growth rate gave 11 % indicating the mean growth rate of soft drinks consumption per year in Niger.

The prediction of the demand for beer bottles was finally reached using the estimated demand for beer based on the mean growth rate of the total consumption of  $r = 8\%$  per year (row 4 in Table 5). Similarly, an estimate based on the mean growth rate of 11 % per year (row 4 in Table 6) was taken for soft drinks.

By lowering the observed per capita consumption growth rate for the purpose of forecasting the future we want to reach two objectives:

- a) to reflect the major opinions expressed in Niger and Nigeria on the relative slow down of economic development, and
- b) to make the study more reliable if it is based on "careful" or pessimistic rather than optimistic assumptions.

This will be seen clearly later on for example in table 13 on page 34. The optimistic econometric extrapolation of demand for soft drinks in Nigeria in 1994 gave the figure of 15,151.104 mln l and corresponded to the growth rate of 23.0 % per year. Figure that we recommend is 5,212.0 mln l - based upon much lower consumption growth rate of 16 %.

Table 5

The Estimated Demand for Beer in Nigerin the Years 1984-1994

Row Name	1984	1985	1986	1989	1990	1993	1994
Beer Consumption (p)	1.609	1.697	1.784	2.041	2.126	2.377	2.460
1 per Capita (exp)	1.791	1.888	1.925	2.276	2.373	2.664	2.761
in litres (o)	1.974	2.079	2.186	2.511	2.621	2.952	3.063
Estimated population 2 in millions	6.174	6.344	6.520	7.273	7.474	8.113	8.338
Mean Rate r = 2.77 %							
Estimated Beer (p) Consumption in 3 Niger in (exp)	9.934	10.766	11.632	14.844	15.890	19.285	20.511
millions of litres (o)	11.058	11.977	12.551	16.553	17.736	21.613	23.021
I Estimated Beer Consumption in Niger in millions of II litres r = 8 % per year	12.187	13.139	14.253	18.263	19.590	23.950	25.539

The mean errors of estimation in row 1 were 5.47 % in 1983  
and 5.80 % in 1994, and were therefore very low.

{p} - pessimistic, {o} - optimistic, (exp) - expected  
(p) and (o) are the lower and upper limits of the interval forecasts  
made at 10 % significance level.

Table 6

Estimated Demand for Soft Drinks in Niger  
in the Years 1984 - 1994

Row	Row Name	1984	1985	1986	1990	1994
1	Consumption (p)	1.686	1.921	2.186	3.623	5.907
	per Capita (exp)	2.060	2.373	2.734	4.818	8.490
	in litres (o)	2.434	2.826	3.283	6.014	11.074
2	Estimated Population r = 2.77	6.174	6.344	6.520	7.273	8.113
3	Estimated Consumption (p) of Soft Drinks (exp) in millions of litres (o) Variant I	10.409 12.718 15.028	12.180 15.054 17.928	14.253 17.826 21.405	26.350 35.041 43.740	47.923 68.879 89.843
4	Estimated Consumption at r = 11 % in millions of litres Variant II	11.10	12.32	32.68	20.76	35.52

The mean errors of estimation in row 1 were 9.77 % in 1983 and 16.35 % in 1994, and were therefore almost three times higher than the ones in the estimation of the beer consumption.

(p), (o), (exp) as in the Table 5

### 3.3 The Market in Northern Nigeria

#### 3.3.1. Main Beer and Soft Drinks Producers

The lack of reliable statistical data unables accurate calculations neither of the volume of production nor the existing production capacity.

According to data available in the Federal Ministry of Industry and Trade there were 36 beer producers and 64 soft drinks producers in Nigeria in 1982. The consulting office Morris Handbury Jackson Le - May Ltd. England, stated that in 1982/83 there were 47 beer producers in Nigeria, and their existing production capacity amounted to 1215 million of litres of beer per year, with a planned expansion to a capacity of 2095 million of litres of beer per year in the nearest few years. A quick growth of beverages production in the last three years is a fact, and the leading beer producers are: Nigerian Breweries and Guinness, whereas the lead in soft drinks is taken by: Nigerian Bottling, Seven-up and Union Beverages.

Our estimations show a production of 990 million of litres of beer and 878 million of litres of soft drinks in 1982 with an existing production capacity of 1095 million of litres per year. This indicates that the existing production capacity in Nigeria is exploited in a higher percentage than in Niger.

#### 3.3.2. Demand for Beverages in Northern Nigeria.

Similarly as with Niger the estimation of the demand for bottles was based on various verified

statistical data on the development of consumption per capita and the growth of population.

Tables 9 and 10 show data on home production and the import of beer and soft drinks in the years 1970-1982.

Contrary to Niger, the import of both beer and soft drinks was the great importance, especially in the period of 1976-1978. In 1978 a formal ban on import of these products has been introduced. None the less duty statistics show that this import, however small, still exists (for example Seven-up imports all of its bottles).

The demand for bottles in Nigeria was evaluated in a similar way as in the case of Niger. A specific procedure has been taken to separate the market of Northern Nigeria.

Table 11 shows the consumption of beer and soft drinks per capita.

Contrary to the gentle and evolutional growth of beverages consumption in Niger, a visibly expansive, exponential growth of both the total consumption and per capita can be observed in Nigeria, in particular in the period of 1980 - 1982. The empirical mean growth rate of beer consumption per capita per year reached a value of 17.40 % in the years 1970 - 1982, and for the soft drinks consumption per capita 27.98 %

Accordingly ( $\frac{11.11}{1.62} - 1 = 0.1740$ ;  $9.85/0.85 - 1 = 0.2793$ ), see figures in table 11)

Models of the development trends have been evaluated to establish the mean growth rate per year, including

Table 9

Home production and Import of Beer  
to Nigeria in the Years 1970-1982

Year	Home Production in millions of litres	Import in millions of litres	Import in millions of Naira	Total Supply of Beer in millions of litres

States 1963 - 2000, National Population

Commission, January, 1978 and Own Calculations.

the dispersion of empirical observations from year to year, and for estimation purposes.

From many models tested on a computer by the classical method of least squares the ones proved to be best statistically are presented.

Model of the Development Trend in Beer Consumption

per Capita ( $y_1^N$ ) in Nigeria in the Years 1970-1982

in litres

$$0.146717 t + 0.495546$$

$$(10.8489) \quad (4.6166)$$

$$y_1^N = e$$

$$R^2 = 0.9145$$

$$s_{ln} = 0.1824$$

$$r_{1ln} = 0.5639$$

$$D = 0.3424$$

The model with the generalized exponential from  $y_1^N$  proved to be better in agreement with empirical data.

$$0.369402 \ln t + 0.07199 t + 0.334337$$

$$(2.0049) \quad (2.1594) \quad (2.6849)$$

$$y_1^N = e$$

$$R^2 = 0.9390$$

$$s_{ln} = 0.1616$$

$$r_{1ln} = 0.3760$$

$$D = 1.2077$$

This indicates that one may consider the existence of an unsteady growth rate of beer consumption per capita of the form:

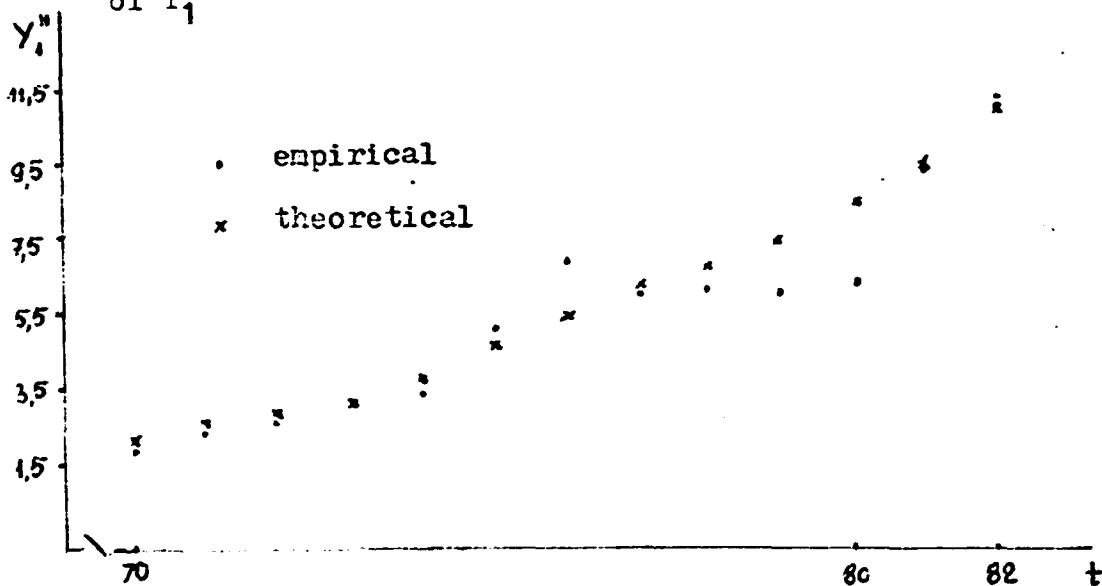

$$r(t) = e^{0.563402 \frac{\ln t}{t} + 0.073199} - 1$$

The t-Student statistics in the  $Y_1^N$  model, however showing the significance of parameters on the level of 10 %, are lowered compared with the  $Y_1^N$  model.

Errors of estimation based on the  $Y_1^N$  model were lower than the ones in the  $Y_1^N$  model.

Picture 3 shows empirical and theoretical values

of  $Y_1^N$

Picture 3. Beer Consumption per Capita in Nigeria in the Years 1970-1982.

Model of the Development Trend in Soft Drinks

Consumption per Capita in Nigeria in the Years

1970-1982 ( $Y_2^N$ ) in litres

$$0.202776 t - 0.692365$$

$$Y_2^N = e^{(10.0063) (4.30448)}$$

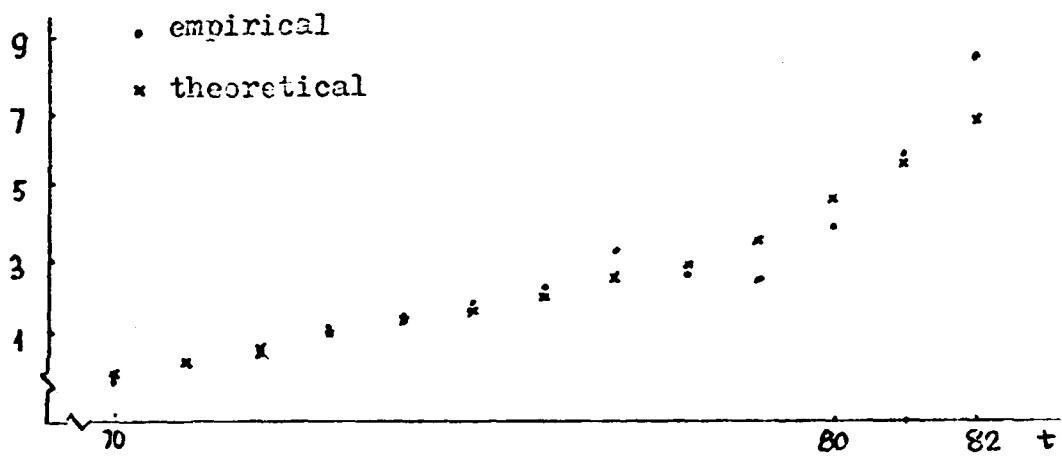

$$R^2 = 0.9010$$

$$s_{ln} = 0.2733$$

$$r_{1ln} = 0.3411$$

$$D = 1.1969$$

Picture 4 shows empirical and theoretical values in accordance with the estimated model  $y_2^N$ .

Picture 4. Soft Drinks Consumption per Capita in Nigeria.

Table 12 shows preliminary variants of estimated demand for beer in the Years 1983 - 1994. The optimistic, pessimistic and expected estimates were evaluated at a level of significance of 10 %, similarly as in Niger. Estimations shown in row 4 were obtained by lowering the mean rate of beer consumption per capita per year from the observed 15.80 % to 9 % and adding the mean population growth rate of 3 %, i.e. the total mean consumption growth rate was taken to be 12 % per years, as compared to the observed 18.70 %.

The mean errors of estimation in row 1 of table 12 were found to be 22.89 % in 1983 and 33.12 % in 1994.

Variant II	Consumption						
	r=16 %						

Table 13 shows estimated demand for soft drinks evaluated on similar principles. Row 4 (variant II) assumes that the mean consumption growth rate per capita will reach 16 % per year in the period under investigation (the empirical growth rate in the period of 1970-1982 had a value of 25.55 %, and the consumption rate per capita reached 22.48 %). Thus the above assumption is not only conservative, but even pessimistic relying on statistical data from the whole investigated period.

It is important to note that the mean errors of estimation in row 1 of Table 13 lied between 34.22 % in 1983 and 51.86 % in 1994, and were therefore relatively high.

Tables 14 and 15 show estimated demand for glass for bottle production and Table 16 the resulting quantity of the non-satisfied demand.

Variant II appeared to be visibly close to the pessimistic estimates derived from econometric models in all cases and therefore has been finally chosen as origin for estimation.

The market of Northern Nigeria has been described by the size of its share in the whole market. A preliminary value of  $M_C = 0.33$  (33 %) has been taken basing on interviews with leading beer and soft drinks producers.

The northern part covers 80 % of the whole territory and over 52 % of the population and therefore a growth of its share in the market of 0.6 % per year has been assumed.

Parameters of the estimated demand for bottles:

n - number of rounds (trips) of one bottle in one year and

s - the percentage of technological loss at filling up; loss at turnover have been determined basing on interviews with beverages producers.

The latter quoted the following values for parameters:

- beer: number of rounds in a year from 6 to 15;  
total loss, that is technological at filling up plus distribution loss, from 4 % to 10 % related to full year production.
- soft drinks: number of rounds in a year from 8 to 15;  
total loss, that is technological at filling up plus distribution loss, from 3 to 8 % related to full year production.

Explanation of the table 14 (table 15 follows the same logic)

Row 1: demand for beer in mln l computed based upon the constant growth rate  $r=8\%$  per year. Initial consumption in 1983 assumed is  $K_{83} = 9.5$  mln l.

Row 2: as row 1,  $r=12\%$ ,  $K_{85} = K_{82} \times (1.12) = 990 \times 1.12 = 1108$  mln l.

Row 3: The beer market share of Northern Nigeria in the total Nigeria beer market is assumed to increase from  $M_c = 0.33$  to  $M_c = 0.40$  over the period of 1983 - 1994 with the yearly average change of  $\Delta = 0.06$ .

Row 4: The demand for beer in Niger and Northern Nigeria:  
(Row 1 + Row 2 x Row 3) in mln l.

Row 5: Number of bottles to be filled  $N_B$  is computed based upon the formula: Demand for beer (row 4) in mln l divided by average capacity of one beer bottle 0.66 l.

Row 6: Demand for bottles  $D_B$  results from our following formula:

$$D_B = (N_B + \Delta N_B) \times \frac{s}{100} + \frac{N_B}{n},$$

where:  $N_B$  - number of bottles to fill

$\Delta N_B$  - the yearly increase in demand for  
bottles  $N_{Bt} = N_{B,t} - N_{B,t-1}$

s - percentage of losses: technological  
losses at the filling stage plus re-  
turns losses

n - number of rounds (trips) of one bottle  
a year

Row 7: Demand converted to glass  $D_G$  is computed based upon  
the demand for bottles and the weight of an average  
bottle:

$$D_G = D_B \times 0.54 \text{ kg of glass per bottle}$$

1 | 10 ml 10 min 10 times  
---+-----+  
2 | Resand / / 1 bottle = 0.54 ml  
| Convecto | ml ml ml ml  
| to Glass |

$\Omega \rightarrow \Omega^2$

Estimated Demand for Soft Drinks

Soft Drinks

Row	Row Name	Assumptions for Calculations	1980	1981	1982

1990	228.102	50.0	178.102

3.4. Glass container Industry in Nigeria

	Name	No of furnace	Location
In operation	Metal Box Toyo Glass Ltd.	3	Asaba, Ogun State
	Delta Glass Co.Ltd.	2	Ughelli, Bendel State
	West African Glass Company Ltd.	1	Port Harcourt, River State
	Ballapur Nigeria Ltd.	1	Kaduna, Kaduna State
Under construction	International Glass Company Ltd.	1	Aba, Imo State

The total installed capacity estimated by Metal Box Toyo Glass<sup>x)</sup> in 1982 was for beer and soft drinks

x) Industry News, Vol. 1, No 2, August 1982, p. 6-7

bottles - 440 million bottles/annum and estimated demand for beer and soft drinks bottles - 360 million bottles/annum. The above mentioned estimation seems to be overestimated for production capacity and underestimated for demand. The major producer of bottles - Metal Box, produced in 1980/81 - 183 mln of bottles which was equivalent to 77748 tons of glass. Delta Glass which started production in 1980 planned to produce approximately 120 million bottles per year - equivalent to appr. 55000 tons of glass. Completely new factory - Ballapur Nigeria, started production in May, 1983. Yearly capacity was planned to be 30,000 tons of glass ie. approximately 70 million soft drinks bottles. West African Glass constructed more than 20 years ago was badly damaged during the Civil War. It was rebuilt in collaboration with foreign investors, but not modernised. At present, having old, poor machinery, the factory can produce approximately 20 million bottles per year.

Capacity of the proposed plant

Bottles	Production pieces of bottles $10^6$	Glass tons
Beer	22.856	11656
Soft drinks - green	45.711	19199
- flint	68.567	28798
Total	137.134	59653

The Plant is assumed to be equipped with two tank furnaces of yearly capacity:

- tank furnace No 1 - green bottles - 30855 t/year
- tank furnace No 2 - flint bottles - 28798 t/year

Total 59653 t/year

that is 150 t/day each furnace.<sup>1)</sup>

1) The derived capacity of the proposed plant of 60,000 t/year reflects a careful consideration of growth of unsatisfied demand shown in table 16, the 3 years construction period 1984 - 1986, as well as the size of furnaces to be competitive economically with already existing ones in Nigeria.

Prices for produced bottles<sup>2)</sup>

Bottles	Nigeria	Niger
Beer bottle	0.23 N	120 CFA
Soft drink bottle	0.20 N	104 CFA

2) In the middle of 1983 prices loco factory in Nigeria ranged for beer bottle 22 - 25 k, and for soft drink bottle 19 - 20 k. During the same time the price in Niamey of beer bottle was 150 CFA, and of soft drink bottle 105 CFA.

Production programme at prices loco factory

Bottle	$\times 10^6$ pcs	Production	Nigeria	Yearly	Niger	Yearly
		#	unit price rev-	unit price rev-	CFA	$10^6$ CFA
			10 <sup>3</sup> N			
beer	22.856	22.856	0.23	5256.8	120	2742.816
soft drink	114.278	114.278	0.20	22857.4	104	11885.848
	137.134	137.134	x	28144.2	x	14628.664

Cost of sales are assumed to be 0.5 % of yearly sales in Nigeria and 1 % of yearly sales in Niger.

#### IV. MATERIALS AND INPUTS

##### 4.1. Raw materials

Most glasses may be considered as composed of oxides. The principal glass-forming oxides are: silica,  $\text{SiO}_2$ , boric oxide  $\text{B}_2\text{O}_3$  and phosphorous pentoxide  $\text{P}_2\text{O}_5$ . When these glasses formers are combined with two or more modifying oxides and fluxes, such as soda,  $\text{Na}_2\text{O}_2$ , potash,  $\text{K}_2\text{O}$ , lime  $\text{CaO}$ , magnesia  $\text{MgO}$ , barium oxide  $\text{BaO}$ , lead oxide,  $\text{PbO}$ , alumina  $\text{Al}_2\text{O}_3$  etc., they comprise the bulk of commercial glasses.

It is possible to produce glasses of a very wide variety of compositions but the range of compositions suitable for commercial use is relatively small. The requirements for commercial production include reasonable cost, ease of melting and fining, viscosity suitable for working and forming without devitrification, reasonably low liquidus or crystallization temperature and resistance to chemical attack. The importance of these requirements varies according to the forming process, and to the value and use of the finished product.

In general glasses are composed of:

- (1) - glass forming oxides (silica, boric oxide),
- (2) - stabilizing oxides, alumina, calcia, magnesia,
- (3) - fluxes (soda, potash, and fining agents).

The approximate range of commercial compositions is shown below:

glass formers - min 55 max 94 %  
stabilizers - 2 max 30 %  
fluxes - 1.5 max 22 %

The extremes, of course, represent unusual combinations of oxides. The common glasses used for window and bottles have silica contents generally between 70 and 75 % and alkali fluxes between 12 and 17 %. The common stabilizing oxides, alumina, lime, magnesia make up the remaining constituent.

The proposed compositions of flint and green glasses for bottles production is as follows:

Oxides	Flint glass	Green glass
silica $\text{SiO}_2$	72.9 %	71.5 %
alumina $\text{Al}_2\text{O}_3$	1.5 %	1.5 %
sodium oxide $\text{Na}_2\text{O}$	14.5 %	14.9 %
calcium oxide $\text{CaO}$	.	
magnesium oxide $\text{MgO}$	10.5 %	11.2 %
barium oxide $\text{BaO}$	0.5 %	0.3 %
iron oxide $\text{Fe}_2\text{O}_3$	0.05 %	0.3 %
chromic oxide $\text{Cr}_2\text{O}_3$	-	0.2 %

The raw materials requirements to produce glass with the above composition are shown below.

raw materials	for flint glass	for green glass
glass sand	62.70 %	61.73 %
soda ash	20.00 %	20.10 %
aluminium oxide	0.90 %	1.22 %
limestone	15.70 %	15.74 %
barite	0.70 %	1.02 %
decolouring agent:		
cobalt oxide, selenium	trace	-
colouring agent:		
bichromate of potassium,		
graphite	0	0.19 %

Raw materials for glassmaking are, as a rule, never perfectly represented by ideal chemical formulas because they invariably contain some impurities. For this reason, percentage compositions calculated from chemical formulas can not be strictly accurate, although the accuracy should remain within prescribed limits.

There are standards defining percentages of impurities acceptable in different raw materials.

Glass Sand -  $\text{SiO}_2$  - max. 98.5 % but  $\text{Al}_2\text{O}_3$  - max. 0.8 %,

$\text{Fe}_2\text{O}_3$  - max. 0.05%,  $\text{TiO}_2$  - max. 0.08 %,

$\text{CaO}$  - max. 0.2 %,  $\text{SO}_3$  - max. 0.02 %.

Soda ash -  $\text{Na}_2\text{CO}_3$  - min. 99 %, but  $\text{Fe}_2\text{O}_3$  - max. 0.006 %

$\text{NaCl}$  - max. 0.7 % and  $\text{Na}_2\text{SO}_4$  - max. 0.04 %.

Limestone -  $\text{CaO}$  - 54-55 %, but  $\text{Fe}_2\text{O}_3$  - max. 0.06 %,

Barite -  $\text{BaSO}_4$  - min. 82 %, but  $\text{Fe}_2\text{O}_3$  - max. 0.2 %,

MnCu - max. 0.003 %

Aluminium oxide -  $\text{Al}_2\text{O}_3$  - min. 97.8 %, but  $\text{SiO}_2$  -  
max. 0.25 %,  $\text{Fe}_2\text{O}_3$  - max. 0.05 %,

$\text{Na}_2\text{O}$  - max. 0.7 %.

As glass sand constitutes the majority of the raw production batch, the quality of sand is the most important. The iron content largely determines whether local sand can be used or not.

The quality of glass sand deposits depend not only upon a correct chemical composition, but also on the grains size. If the grains are too large, melting becomes slow, but if grain size is too small there may be trouble with dusting the furnace both inside and outside.

Furthermore, the quality of sand must be reliably stable or must be made so by pre-mixing or preprocessing. This is also true for any other raw-material used. Raw-materials used for glass-making fall into two natural classifications:

1. - naturally occurring minerals that may be purified or beneficiated in some manner after extraction from earth,
2. - commercial heavy chemicals.

Into the first category falls: sand, limestone, barite, while to the second one soda ash, aluminium oxide, and decolouring and colouring agents.

Raw-materials of the second category have to be imported, as there is no production of chemicals in Niger and Nigeria. It will probably be also necessary to consider import of barite from abroad.

As far as glass sand and limestone are concerned, there are production of limestone in Nigeria and there are large potential deposits of glass sand in Nigeria and Niger. Unfortunately sand deposits in northern part of Nigeria and in Niger have not been investigated properly and in sufficient details.

#### Nigeria

The Geological Survey Department of Federal Ministry of Mines and Power in Kaduna has been the basic source of informations concerning investigations of sand deposits in northern part of Nigeria. The available reports contain however only written statement that in different regions glass sand deposits exist.

The list of reviewed documents follows:

#### Silica sand:

1. Geological survey of Nigeria (GSN) - report no 1381 dated 1964 "A summary of the principal known deposits of glass sand in Nigeria", compiled by J.E. Wandby-Smith specified silica sand deposits in Northern Nigeria in following areas:
  - a) Bida, Niger Province - from river terraces near Bida, ideal fraction 42-53 %, high iron content,
  - b) Mokwa Area, Niger Province - from river terraces in this area, badly graded.

From river Awan and Jebba bridge - contained too much fine materials.

Mokwa Bida - Ferry and Lafiagi - too much coarse materials.

c) River Kaduna, near Kaduna - near Road Bridge and river Kaduna 2 miles up stream from the village of Birnava - iron content 1.14 %.

2. GSN - Report no 1279, dated 1961 informs only that analysis of 4 samples taken from Mokwa Area and 4 samples taken from river Kaduna revealed content of  $\text{SiO}_2$  between 85.33 and 96.86 % and of  $\text{Fe}_2\text{O}_3$  between 0.81 and 1.46 %.

3. GSN - Report No 1363 done by Colonial Geological Surveys, Imperial Institute, London S.W.

The analysis of the samples taken in 1951 from Jaom Ivo Coal Mine, Enugu where the sand deposits are considered to be unlimited, did not give satisfactory results.

The sand is badly graded and  $\text{Fe}_2\text{O}_3$  content is the maximum permissible for the manufacture of high class of domestic production.

Potash Feldspar:

3. GSN - Report No 1430, P. Antolini, Senior Geologist, ITA specifies the feldspar occurrences in Lokoja area (Kwara State) area:

a) Lokoja - Okene road, two deposits in Osara Forest Reserve, remote from any habitation:

- 4 1/2 miles on a bearing of 125° true north from milepost 16 on the Lokoja - Okene Road.

The melting test gave positive results, the button was of good quality, perfectly white, transparent and glazed.

The mineral composition of the sample gave the following results:  $\text{Al}_2\text{O}_3$  - 17.88 %,  $\text{Fe}_2\text{O}_3$  - 0.07 %,  $\text{K}_2\text{O}$  - 11.34 %,  $\text{Na}_2\text{O}$  - 3.97 %,  $\text{CaO}$  - 0.18 %. Several thousand tons of loose feldspar blocks are available.

b) 2 miles south of milepost 7 on the Lokoja - Okene road; large blocks of a potash feldspar of the highest quality, including in places large quartz segregations and rare mica were found on the slopes. About 1000 tonnes of feldspar occur on the surface as scree and in situ.

Chemical analysis and the melting test done by D.J.O'Leary (GSN Laboratory Report No 1399) gave satisfactory results for 5 samples treated:

- I) Outcrop No 1, Osara Forest Reserve
- II) Outcrop No 2, Osara Forest Reserve
- III) Udarechu, Okene area
- IV) Mile 16, bridge marked 16/14 on the Okene - Oguda Market Road,
- V) Macroperthite, unknown locality, Okene area.

The melting point:  $1250^\circ$  -  $1300^\circ$ ; carried out on cones fired on electric furnace which reached

temperature  $1370^{\circ}$  in 5 hours, an average increase of  $260^{\circ}$  per hour.

The Okene area feldspar reserves are considered as sufficient to satisfy Nigerian requirements for many years.

4. GSN - Report No 10023 prepared by Arthur W. Smidt International Inc. in 1959 indicates the feldspar deposits in North-Eastern part of Northern Region without more precise indications of places and reserves.

#### Limestone

1. GSN - Report No 10023 (mentioned above) indicates resources existing in Calabar in the South-East corner of Eastern Region of Nigeria. The chemical analysis carried on a sample gave the following results:

Calcium Oxide	55.4 %
Magnesium Oxide	0.45 %
Iron and Aluminium Oxides	0.23 %
Insolubles	0.63 %
Loss in Ignition	43.29 %

The limestone is of a good quality. It can be quarried and shipped in lump for crushing and screening at the glass plant.

Nota: There are probably more limestones deposits, namely in Sokoto and Bauchi, however available

documents give only very preliminary informations and further analysis have to be carried on.

Existing glass works in Nigeria purchase limestone from Jateura Marble Industry, Lokoja, Kwara State. Limestone has been commercially produced in Nigeria since 1973 with 1980 production volume of 2,336.4 metric tons (1979 production was 1,725.4 metric tons).

#### Dolomite

1. GSN - Report No 10023 (mentioned above). There are known deposits of various grades of dolomite and dolomite limestone in the Western Part of Nigeria; deposit with 25 % Magnesium Oxide is located in Abuja, and dolomite limestone with 15 % Magnesium Oxide near Kwakuti. Both locations are close to the railroad from Lagos to Minua (about 200 miles from Lagos by rail).

Nota: Existing glass-works in Nigeria purchase dolomite from W.P. Syndicate, Jos State.

#### Glass sand in Kano State

1. The proposed location of the plant is Kano State. In 1971 "Preliminary Report on a Survey for Glass Sands around Kano, Kano State" was done by W.C. Mbonu (geologist) with the following indications of deposits:

Kogin Kano

- a) Chiromowo bridge area
- b) Tabara dridge area

Kogin Chalawa:

- a) Kogin Watan: Dewaki - Lambu Road
- b) Kogin Natari: Watari Bridge area (Gwarzo Road)
- c) Chalawa George area (water works section)

Samples taken from the above mentioned location seem to be accentable but the content of iron is too high (1.2 - 2.9%). No evaluation of the deposits sizes were given.

2. The Kano State Government indicates the existence of large deposits of glass sand in the area of Gumel, Kazaure and Babura (North of the Kano State). Geological survey has not been done yet or, if so, not disclosed to the mission during the visit of the Kano State Government.

Niger

Silica sand

Over 10 years ago the Polish mission identified glass sand deposits in Dallol Bosso in the region of Birni - N'Gaoure near Dosso. The sand is of a good quality with low content of iron. Other deposits exist in the region of Malbaza, but no evaluation of them are known.

During the travel from Maradi to Niamey the present mission selected three additional potential places of

deposits worthwhile to look more closely at. All of them are located along the road Maradi - Niamey:

- a) Gagama, approximately 80 km West of Guidan Roumji,
- b) 40 km West of Dogondouchi,
- c) 70 km West of Dogondouchi.

#### Limestone

The limestone deposits exist in the region of Halbaza - Madana towards the North and North-West. These deposits are exploited by the Halbaza Cement Factory and are large enough to aliment both: production of cement and glass for many years.

The limestone deposits were geologically surveyed in 1962. Within the survey the Halbaza and Keita deposits were more closely evaluated and two other near located potential deposits were indicated. First, South-West of Garadaoua, 12 km South-East of Keita, and second, in the region of Ipnaska between Tahoua and Keita. An average compositions of limestones from the two (1) and (2) Halbaza samples are given in the following table.

%	CaO	Al <sub>2</sub> O <sub>3</sub>	Fe <sub>2</sub> O <sub>3</sub>	SiO <sub>2</sub>
(1)	54.27	0.45	0.54	1.05
(2)	50.56	1.37	0.84	4.81

#### Dolomite

Deposits of dolomite were found near Ayeron and the production of marble has been started. The size of

deposits is not known. Because of this, and also because of the distance from Ayeron (near Mali frontier) to the potential location of the plant in Maradi - the limestone would be the reasonable substitute for dolomite.

Feldspar

Deposits of feldspar had been identified in the region of Tillabery and Tera. Based upon the report made by Politechna in 1964 these deposits are suitable for production of ceramic products. It would be important to test whether they are also suitable for glass production.

Important conclusion

In both countries exist probably essential raw materials for glass containers production, and in both countries the same remaining components of a glass batch will have to be imported. However, the detailed geological survey should be done before the next step concerning the glass production study is taken. This survey should take into consideration the proposition of a potential location of the plant:

in Niger - the region of Maradi

in Nigeria - the region of Kano State.

**4.2. Estimates of costs of production inputs**

The estimation of costs of material inputs was made based upon the assumed programme of production and prices estimated by the research team for locally

available inputs and based upon international prices for those inputs which will have to be imported.

At the final stage of editing of this report, we had the opportunity to study the "Investigation of Raw Materials for the Production of Glass Containers in South Niger and North Nigeria" -- the UNIDO project DP/RAF/77/020 prepared by KHD Humboldt Wedag AG. The basic conclusion of the report is that .. " ... basically no more than soda ash and other minor components will have to be imported...."<sup>1)</sup> for production of glass in Niger and North Nigeria. The report in general gives more detailed arguments for conclusions we took in the report.

Note: Prices of raw materials in Nigeria are based upon the field research in this country.

Household size / population of 0.441 in 1979/ is the  
least of Kano State / population 8.6 in 1979/. The  
rural population in Kano was in 1978 359.4 in which average  
annual temperature was  $23.1^{\circ}\text{C}$ , and rain, daily  
19.96. Kano is a relatively dry state at the rate of 117.6  
standard concept and presents conceivable interconnection  
geographical. Intersections to mention is that the Kano State  
government has been strongly interested in building

Figure 2. The relationship between the total length of the root system and the number of roots.

a glass plant in this State.

During the meeting held in Kano with the mission, the Government refused to give more details on raw materials availability and other important informations, making at the same time impressions that such data were in his possession. The mission was informed that these informations and for going cooperation would have been granted, if the objective of the mission had been the feasibility study of the glass plant in the Kano State. As no sufficient cooperation was granted by the Kano State Government, it is difficult to propose any more precise location of the plant. However the three crucial points to consider are: transport, water and manpower. In fact both in Niger and in Nigeria, water for the plant is assumed to be delivered from the plant owned water wells. The general water availability from deep water drilling is favorable both in Maradi region and on the Kano State territory. The transport in both cases is not a limiting factor as sufficient quality roads are available in both countries. In both cases electrical energy is assumed to be locally generated. The manpower training will be necessary also in both potential location. Maradi region seems to be an optimal location from the Niger point of view, while Kano State territory from the Nigeria point of view.

#### 5.2. Cost of location

The estimated costs of location of the plant are given in Schedule 5-1 for Niger and Nigeria separately.

## VI. PROJECT ENGINEERING

The project engineering described in the first part of this chapter is based upon the study made by Vitrocerprojekt - Warsaw, which is the leading Polish development center of glass and ceramic industries. The second part includes the estimation of investment and civil engineering costs.

### Part I: Project engineering

#### 6.1. Description of the Plant

The Plant incorporates the following objects:

- melting and forming department
- annealing dept., painting dept. and ready-made products store
- batch house and raw-materials store
- electric power supply station
- fuel station
- circulation water station
- waste gases extraction chimneys
- social welfare and canteen
- administrative and first aid room building
- gate-house
- ready-made products store
- roads and squares
- other auxiliary objects

#### 6.2. Data specifying Plant size

- 2 glass tank furnaces of continuous operation
- 6 automatic machines type IS-6 BD-DC (3 automatic machines at each furnace,
- 2 automatic machines for painting
- 6 annealing lehrs
- 2 kilns for ornament firing

#### 6.3. Production assortments - bottles

- for beer - 0.6 l capacity, 510 g weight
- for soft drinks: sprite  
schwens  
coca  
pepsi
- fanta 0.25 - 0.3 l capacity  
miranda weight 300 - 420 g  
tonic  
orange  
lemonade

#### 6.4. Kind and colour of glass

- soda-lime-glass - green (tank No 1) for: beer, sprite, schwens bottles
- soda-lime glass, flint (tank No 2) for: coca, pepsi, fanta, miranda, orange-lemonade, tonic bottles.

## 6.5. Production capacity of the Plant

### 6.5.1. Basic data:

- beer bottle of 0.6 l weight = 510 G
- soft drinks bottle of 0.3 l - weight = 420 G
- number of automatic machines for beer bottles  
(green, production = 1)
- number of automatic machines for soft-drinks  
bottles (green) production = 2
- number of automatic machines for soft drinks  
bottles (flint, production = 3)
- number of effective days of automatic machines  
operation a year = 320
- beer bottle forming rate = 62 pcs/min.
- soft-drinks bottles forming rate = 62 pcs/min.
- percentage of waste products = 20 %<sup>x)</sup>
- continuous, 4 shifts operation cycle of the Plant.

---

x) relatively high waste products level has been assumed due to high percentage share of screen printing bottles; it has also been calculated as the total waste at the forming and printing stages.

#### 6.5.2. Production scale

Kind of bottles	Net production capacity (10 <sup>3</sup> pcs/ /year)	Total weight of produc- tion (t/year)	Total volume of bottles (Hl./year)
- for beer	22,856	11,656.0	137,136.0
green, for soft-drinks	45,711	19,190.0	
- colourless, for soft-drinks	68,567	28,793.0	342,834.0
Total:	137,134	59,653.0	479,970.0

Total tonnage of green bottles (tank No 1)

- net 59,653.0 t/year

Total net tonnage of flint bottles (tank No 2)

- 28,793.0 t/year

Total net tonnage of the Plant production

- 59,653.0 t/year

#### 6.5.3. Percentage share of bottles in colours

The quantity analysis of green and flint bottles proportion carried out on the basis of some biggest beer and soft-drinks manufacturers in Nigeria and Niger, indicates as follows:

1. beer bottlers are in their majority green
2. the percentage proportion of flint to green

bottles suitable for soft drinks in Nigeria  
manufacturers are as follows:

- Drinco Industries Ltd. - Kaduna
  - flint 60 %
  - green 20 %
  - amber 20 %
- Arewa Bottlers - Kaduna
  - flint 66 %
  - green 34 %
- Nigerian Bottling Co.
  - flint 63 %
  - green 37 %
- Union Beverages
  - flint 100 %

In view of above data the arrangement of furnaces  
and automatic machines for the bottles production  
in proposed project has been set as follows:

- beer bottles - green in 100 %
- soft drinks bottles - green in 40 %
- soft drinks bottles - flint in 60 %

If the other proportion of green to flint bottles  
is required, periodical change of glass melt in  
one of the furnace is provided for.

On the basis of annual production capacity net, calculated in § 6.5.2., the daily production output of each of the furnace has been defined as 130 t/24 hours

(taking into consideration coefficient for periodical fluctuation of glass melt yield).

## 6.6. Manufacturing process description

### 6.6.1. Delivery, unloading and storing of raw-materials

Umbrella roof for the sand and raw-materials store will be positioned close to the batch house. Delivery of the raw-materials is to be effected by road transportation, storing in bulk, or in heaps on pallets (raw-materials in bags).

### 6.6.2. Raw materials processing

#### Sand

Drying is the only sand treatment, and no equipment for any other processing is provided for. However, from obtained, although incomplete, geology data relating to this material, it appears, that due to the contents of oversize and undersize particles, clay fraction and high percentage of  $\text{Fe}_2\text{O}_3$ , one or several of the following conditioning methods is to be applied disintegration, screening, rinsing, magnetic separation, raw material bedding, etc.

The specific conditioning method, as well as the scope of respective equipment will be specified after selection of sand deposit for the glass-works purpose (scale of deposit, chemical and granulometric compositions of material). The sand treatment should be arranged within the mine area.

Cullet

Crushing of cullet in the crushing mill is assumed

Other raw materials

Other raw materials are assumed not to require additional processing.

6.6.3. Preparation of batch of raw materials

Two batch preparation lines are provided for in the batch house. One for the green glass, the other for flint glass. Each line incorporates: bucket elevators, set of silos located above the weighing hoppers, collecting conveyor for transportation of weighed raw-materials, and mixer. Batch house is equipped with the passenger-freight lift for vertical transportation of raw materials in bags. The weighing hopper is fitted under each silo, weighing and feeding appropriate portion of raw material on collecting conveyor.

The said portions are supplied to the disc-rake type mixer for mixing, and then, in the form of batch, conveyed by means of belt conveyor on the trestle bridge to the tank furnaces hall.

The whole batching cycle is automatically controlled, however manual control is also available.

The system of raw materials weighing, mixing and transportation to the tank furnace department is equipped with the electrical locking system avoiding wrong preparation or wrong feeding of the batch into furnaces.

#### 6.6.4. Transportation and feeding of the batch

The supply of batch (from the outlet of mixer) from the batch house to the melting and forming department is carried out by means of belt conveyor, located inside the covered trestle bridge, and reverse conveyor delivered batch to batch hoppers located on both sides of furnace.

Feeding of batch to the furnace is arranged by means of batch charger located below each batch hopper.

#### 6.6.5. Processing, transportation and feeding of cullet

Cullet is used in the glass melting process as the catalytic agent, utilizing by the same glass broken in the process of selection, production, etc.

The cullet share is determined as 30 % by weight in relation to the other raw materials concerned. Two separate cullet stores (for green and flint glass) are provided for. Only cullet produced in the plant is taken into consideration. The said cullet is to be collected mechanically from underneath of forming automatic machines, selection stands as well as the printing department, and transported by means of mechanical trolleys to the cullet processing stand in the production building.

After being crushed, the cullet is to be mechanically supplied to the cullet hopper. Under the hopper there is weighing hopper suitable for weighing of the relative portions of cullet. The weighing unit is located close to the belt conveyor supplying

batch to the melting department.

The portions of cullet are being dumped on the batch and convoyed to the tank furnace department.

#### 6.6.6. Glass melting

The melting process is to be carried out in two tank furnaces of 130 T/24 H each, one provided for the production of green glass, while the other for the flint glass.

Both furnaces are of the same design fired with the heavy oil. Each of the tank furnace is composed of melting end, working end, and is equipped with three feeders and the device suitable for recovery of heat from the waste gases.

The melting process will be controlled and inspected by the control-measuring equipment. The tank furnaces as well as the forming automatic machines will be located on the 0,00 level in the melting and forming department.

#### 6.6.7. Products forming

The liquid glass from the working end of the tank furnace will flow through the forehearth and feeder to the automatic machines. The forehearth will be fired with the light oil. Both tank furnaces will be equipped with the same type of forming machine, i.e. IS-6 BB-DG, three of them for each furnace.

The IS type of automatic forming machine was chosen from available machines for the following reasons:

- it enables increase of production capacity by installation of the additional forming stations,
- it enables universal production of bottles of various types and various shapes,
- it is generally used world-wide, including Nigeria (Metal Box Toy Glass, Balapur) enabling by the same, joint management of spare parts, moulds, etc.
- it may be used for the wide-opening products, such as jars by installation of additional equipment type F-B, if so required. Each automatic forming machine will be supplied with glass by means of feeder.

The finished products will be delivered to annealing lehr by means of metal apron conveyor and pusher.

The construction of forming department, as well as the clearance of tank furnaces axis shall have to be designed in the way enabling further production increase by installation of the fourth automatic forming machine at each furnace.

#### 6.6.8. Annealing, sorting and packing

The ready made products will be annealed in the annealing lehr fired with the light oil. Each automatic forming machine cooperates with one annealing lehr of the belt width 1.8m. At the end of each annealing lehr the set of equipment suitable for

automatic products control (such as: dimensions control, breakages, etc.), and visual inspection are provided for. The palletizer is also provided. The palletized products are to be covered with the plastic foil, which is shrink wrapped in the electric, chamber oven. From the oven the pallets are transported by means of mechanical trolleys to the store. The annealing, sorting and packing departments, as well as the finished products store are located at the 0,00 level.

#### 6.6.3. Overprint and its firing

The part of products is to be subject to printing; on the automatic devices for paint-screen process. The products on the pallets, not wrapped with the foil, will be delivered from packing stand to the printing devices by means of mechanical trolleys, and then manually supplied on the printing machine transporting unit. Tri-colour printing is available. Then the products are mechanically conveyed and pushed into the tunnel kiln, electrical heating. At the kiln output products are manually sorted and put on the pallets. Then pallets are wrapped with the foil and shrink in the electrical oven as described in § 6.6.8. and stored in the store. The production capacity of the painting department enables painting and firing of approx. 40 % of the forming department output.

#### 6.6.10. Storing and despatch of finished products

Pallets with the products on them are transported from production lines to the ready-made products store by means of fork lift truck and stored there in 3 levels. The pallets with products may be also stored on the stockyard outside the production building. Pallets are loaded on trucks and trailers, by means of fork-lift trucks, and further supplied to the end-users.

#### 6.7. Basic processing data

##### 6.7.1. Chemical composition of glass

The following approximate chemical composition of glass melt is suggested:

	<u>Flint glass</u>
silica	- $\text{SiO}_2$ - 72.9 %
aluminium oxide	- $\text{Al}_2\text{O}_3$ - 1.5 %
sodium oxide	- $\text{Na}_2\text{O}$ - 14.5 %
calcium oxide	- $\text{CaO}$
magnesium oxide	- $\text{MgO}$ - 10.5 %
barium oxide	- $\text{BaO}$ - 0.5 %
iron oxide	- $\text{Fe}_2\text{O}_3$ - 0.05 %

	<u>Green glass</u>
silica	- $\text{SiO}_2$ - 71.5 %
aluminium oxide	- $\text{Al}_2\text{O}_3$ - 1.5 %
sodium oxide	- $\text{Na}_2\text{O}$ - 14.9 %

calcium oxide	= CaO	-	11.2 %
magnesium oxide	= MgO	-	
barium oxide	= BaO	-	0.3 %
iron oxide	= Fe <sub>2</sub> O <sub>3</sub>	-	0.3 %
chromic oxide	= Cr <sub>2</sub> O <sub>3</sub>	-	0.2 %

#### 6.7.2. Annual requirement of the raw materials

The estimated annual requirement of the raw materials for the planned production programme (as per 6.5.2. above, is as follows:

Raw material	Annual requirement (%/year)		
	basic	Total	Flint glass
Sand	46,235.0	23,473.0	24,762.0
aluminium oxide	826.0	337.0	489.0
soda ash	19,550.0	7,433.0	9,063.0
lime-stone	12,192.0	5,977.0	6,315.0
bermite	670.0	262.0	408.0
<hr/>			
Total - basic raw materials	77,476.0	37,427.0	49,039.0
<hr/>			

#### Auxiliary

##### Decolourisers

cobalt oxide	0.3	0.3
cerium selenine		

##### Dyestuff

##### dichromate

graphite	75.0	75.0
Total - auxiliary materials	75.0	0.3

chemical composition: SiO<sub>2</sub> - min. 93.5 %

#### Glass sand

#### Quality requirements of glass raw materials:

required at site.

the additional processing and conditioning is not  
able the standards in force for Glass Industry, and  
chemical composition and grain-size in accordance

It is assumed that the raw materials are of the

Soda Ash

Chemical composition

$\text{Na}_2\text{CO}_3$	- min. 89 %
$\text{NaCl}$	- max. 0.7 %
$\text{Na}_2\text{SO}_4$	- max. 0.04 %
$\text{Fe}_2\text{O}_3$	- max. 0.006 %

particles non-soluble

in water - max. 0.04 %

grain-size:

basic fraction	- 1.0 - 0.5 mm
over-size particles	- max. 10 %
under-size particles	- max. 10 %

Limestone

Chemical composition

$\text{CaO}$	- 54.0 - 55.5 %
$\text{Fe}_2\text{O}_3$	- max. 0.06 %
particles non-soluble in HCl	- max. 2.0 %

grain-size:

remains on the sieve of the square side dim. eye:

0.15 mm	- max. 2.0 %
0.075 mm	- max. 25.0 %
below 0.075 mm	- min. 70 %

Barite

Chemical composition

$\text{BaSO}_4$	- min. 82 %
-----------------	-------------

$\text{Fe}_2\text{O}_3$	- max. 0.2 %
MnCu	- max. 0.003 %

grain-size:

below 0.1 mm	- max. 40 %
0.1 to 0.3	- min. 50 %

Aluminium oxide

Chemical composition

$\text{Al}_2\text{O}_3$	- min. 97.3 %
$\text{SiO}_2$	- max. 0.25 %
$\text{Fe}_2\text{O}_3$	- max. 0.05 %
$\text{Na}_2\text{O}$	- max. 0.7 %
ignition loss	- max. 1.2 %
$\text{H}_2\text{O}$ content	- max. 2.5 %

grain-size:

0.1 to 0.3 mm	- min. 95 %
---------------	-------------

Potassium dichromate

Chemical composition

$\text{Cr}_2\text{O}_3$	- min. 66.5 %
water insoluble substances	- max. 0.3 %
sulphates converted to $\text{SO}_4$	- max. 0.5 %
Chlorides converted to Cl	- max. 0.8 %
Substances precipitated with ammonia in form of oxides	- max. 0.2 %

Calcium converted  
to Ca+2 - max. 0.2 %  
Losses on drying  
in 120-130°C - max. 1.0 %

Apart from the raw materials the Plant will be  
using the following materials:

- wooden pallets (1 off for 1500 bottles) - single purchase 7700 pcs + annually - 800 pcs
- foil covers (1 off for 1500 bottles, - 39000 pcs) year
- paints (700 kg for 1 million of bottles to be painted) - 37.3 t/year
- dissolvent (7 kg for 1 million of bottles to be painted) - 380 l/year
- chomette elements (eyes, plungers) - 3 t/year
- other auxiliary materials (greases, oils, technical gases).

#### 6.7.3. Fuel

The following kinds of fuels will be used:

- heavy oil (melting end of tank furnaces)
- light oil (working end of tank furnaces, forehearth, annealing lehrs, sand dryer)
- fuel oil (Diesel engine for generators)
- liquid gas LPG (laboratory burners).

#### 6.7.3.1. Heavy oil consumption

Melting end of the tank furnaces  $2 \times 1100$  kg/hour,  
i.e.  $2 \times 24000$  kg/day, i.e.  $2 \times 8800$  t/year,  
14 days stock of heavy oil in tanks is assumed.

#### 6.7.3.2. Oil characteristic

Heavy oil, specific density  $0.95 \text{ kg/cm}^3$ , net calorific value 18500 BTU/pound, max. viscosity 125 at,  
at  $122^\circ\text{F}$ , max. sulphur content = 2 %

#### 6.7.3.3. Light oil consumption

Working end of tank furnace -  $2 \times 60$  kg per hour,  
i.e.  $2 \times 1440$  kg/daily, i.e.  $2 \times 520$  t/year.

Feeders (6 pcs)  $\times 120$  kg/h, i.e.  $2000$  kg/day,  
i.e. 1040 t/year.

Annealing lehrs (6 pcs) -  $240$  kg/h, i.e.  $5760$  kg/day,  
i.e. 2880 t/year.

Sand dryer (2 pcs) -  $120$  kg/h, i.e.  $1920$  kg/day,  
i.e. 7.0 t/year.

Total -  $528$  kg/h, i.e.  $13440$  kg/day, i.e. 4060  
t/year.

#### 6.7.3.4. Full oil consumption

$24.3 \text{ t}/24 \text{ h}$ , i.e. 3000 t/year.

#### 6.7.3.5. Liquid gas consumption

$50 \text{ kg}/24 \text{ h}$ , i.e. 13 t/year.

#### 6.7.4. Electric energy

The Plant will be supplied by the own electric power from station equipped with electric power generators as follows:

2 operating of electric power 2.3 MW each  
1 spare      of electric power 2.3 MW  
supplying alternative current (AC) of voltage  
380/220 V and frequency 50 Hz.

##### Justification

The basic condition of success of Glass-Werk of continuous technological process is stable feeding with the basic mediums, including electric power supply.

It is to be stated, that the stability of power supply from the energy mains in both countries is unsatisfactory for this kind of production (frequent and long intervals in power supply, significant, temporary voltage drops).

Additionally in the places of possible location of the Plant, the arrangement of public power supply lines do not enable supply of the said Plant from at least two independent supply sources. Hence there was suggested to supply power for the plant as above.

The total electric power installed will reach:

6.25 MW

including lighting 350 kW

approximate annual energy consumption A = 23.2 kWh.

The power distribution to be effected through distribution station and cable network.

Electrical-shock protection by zeroing.

#### 6.7.5. Other installation

The installation of control-measuring system and low-current installation (30 telephones, fire-fighting alarm with 20 off sensors) are also provided for.

#### 6.7.6. Water in circulating system

The circulating water system is assumed in the project.

The refilment of the water in the circulating system will be arranged from the well by means of pumps.

Water will be treated by devices located in the circulating water station.

The system will be equipped with the cooler and elevated water tank.

Refilment of water in circulating system average 33 cu/m, max. 36 cu/m.

Consumption of industrial water is: average 43 cu/m/h, 56 cu/m/h.

#### 6.7.7. Water for drinking, social and industrial purposes

The installation of water for drinking, social and industrial purposes is provided for (water to be softened).

#### 6.7.8. Compressed air

Compressed air of pressure 7 ata, and capacity

218 cum/min. will be produced by the compressors (operating and spare).

Compressors will be located in the power distribution building.

Compressed air installation to be equipped with the following:

- cassette filters at the air intake
- dewatering vessel
- air deoiling devices
- compressed air compensating vessel

The distribution of compressed air to the supply points by means of steel piping.

#### 6.7.9. Vacuum

There will be provided two vacuum pumps (one operating, one spare).

The vacuum installation capacity 39 cum/min.

The vacuum value 83 % (635 mm Hg)

#### 6.7.10. Sewage

The open installation for sewage collection as well as the sewage treatment plant is provided for in the project.

Part II: Estimation of investment and civil  
engineering costs.

Nota: Numbers used to identify tables should not  
be identified with sections of the first  
part of this chapter.

They correspond to the numbering structure  
of the Manual for the Preparation of In-  
dustrial Feasibility Studies recommended by  
UNIDO.

F - foreign costs

L - local costs

## VII. PLANT ORGANIZATION AND OVERHEAD COSTS

With regard to technology level of automatic glass containers production and also with regard to the size of the proposed plant it seems most efficient to consider the major items of the overhead costs, namely technical (service) and administrative.

Organization structure is assumed to be the same for Niger and Nigeria

### 7.1. Plant management

It is assumed that the management staff will come from local human resources and will consist of 1 general & 5 deputy directors. The following are the functions concerning deputy directors.

- technical director
- production director
- administration director
- commercial director
- economical director

### 7.2. The local personnel

The total personnel of the plant is assumed to be 445 persons:

direct labor workers	365 persons
technical supervision	15 "
administration	23 "
general service	42 "

#### 7.3. Foreign assistance

The foreign assistance would consist of 3 permanent experts:

- technological specialist
- chemical engineer - specialist of the raw materials composition and batch preparation,
- mechanical engineer - specialist of IJ machines.

#### 7.4. Schedule of the management structure

The schedule presents the general organisation structure of the plant management without a detailed division of duties and responsibilities.

#### 7.5. Overhead costs - administration and finance

##### Nigeria

###### 7.5.1. Cost of local administrative and commercial personnel

The following table presents the evaluation of yearly management and administration overheads.

Item	Description of function	Number of persons	Annual salary	Total
1.	General director	1	21,000	21,000
2.	Deputy directors	5	14,000	70,000
3.	Technical and engineering supervision	15	4,000	60,000
4.	General administration	17	2,800	47,600
5.	Adm. office maintenance and general service	42	1,600	67,200
7.	Total general	80	x	265,800

### 7.5.2. Board of Directors

It is assumed that besides the plant management - the constituted, at the incorporation stage, board of directors will also function during the exploitation period.<sup>1)</sup>

Yearly remuneration of 5 directors + 1 secretary  
is assumed to be yearly 60,000 ₦

### 7.5.3. Foreign assistance

Estimation of annual cost 133,000 ₦  
or 180,000 ₦

*Nota:* The permanent foreign assistance may be organized to suite best the needs of the plant.

### 7.5.4. The general administration functioning and indirect materials (telephone, furniture, travel etc...)

These costs are usually assumed to be calculated for the glass plant at the level of 3 % of total wages and salaries yearly fund of the plant. We exclude from this figure the salaries of foreign experts and of the Board of Directors. This means that only home acting personnel salaries and wages are taken as the basis for estimation.

The total salaries and wages (table 3.2.1) = 1,359,800 ₦  
Foreign assistance (point 7.5.3 = - 133,000 ₦  
Board of Directors (point 7.5.2, = - 60,000 ₦  
1,141,800 ₦  
3 % of 1,141,800 = 34,254 ₦

1) It is important to distinguish between acting plant management described in 7.5.1. and Board of Directors which constitutes a promoters supervision and strategical policy making body. Board of Directors in Nigeria is rather temporary controlling and guiding organ than acting management.

#### 7.5.5. Insurance fees and finance costs

0.5 % of the cost of the production equipment

0.5 % of 23,994,000 N = 120,000 N

#### 7.6. Overhead costs - service cost centers

##### 7.6.1. Estimate of production cost: current maintenance and spare parts

Year of production	% of the equipment value	Maintenance costs N
1	1 %	239,900
2 and following	1.5 %	359,850

##### 7.6.2. Major tank furnace maintenance

The cost of the tank furnaces maintenance is estimated based upon the assumption of the 50 % tank furnaces value depreciates over the period of 4 years. The estimated value of the tank furnaces consists of 12.5 % of the total value of machinery and equipment + 50 % of the cost of the equipment erection:

12.5 % of 23,994,000 plus 50 % of 4,773,000 =

= 5,398,000 N

$$\frac{5,398 \times 50}{100 \times 4} = 674,750 \text{ N}$$

The estimated foreign/local part structure is

35 % foreign currency or 236,162 N

65 % local currency or 438,587 N

7.7. Overhead cost summary

Item	Item description	Local currency N	
		1	2 and following
1	Administration and finance cost centers		
1.1	Indirect personnel	265,300	265,300
1.2	Board of directors	60,000	60,000
1.3.	Functioning costs	34,254	34,254
1.4	Insurance, fees and finance costs	120,000	120,000
1.5	Foreign assistance	138,000	138,000
	Subtotal	618,054	618,054
2	Service cost centers		
2.1	Current equipment maintenance	239,900	359,300
2.2	Major tank furnace maintenance	674,750	674,750
	Subtotal	914,650	1,034,550
	Total overheads	1,532,704	1,652,604

7.3. Overhead costs Foreign/local currency

Item	Item description	Foreign/Local currency (N)					
		Year of production			2 and following		
		FC	LC	Total	FC	LC	Total
1	Administration and finance cost centers	133,000	480,054	613,054	133,000	480,054	613,054
2	Service cost centers	236,162	678,488	914,650	236,162	798,388	1,034,550
	Total overheads costs	374,162	1,158,542	1,532,704	374,162	1,278,442	1,652,604

Niger

7.5 Administration and finance

7.5.1. Management and administration overheads

10 <sup>3</sup> CFA				
Item	Function description	Number of persons	Annual salary	Total
1.	General director	1	1,920.-	1,920.-
2.	Deputy directors	5	1,440.-	7,200.-
3.	Technical and engineering supervision	15	730.-	11,700.-
4.	General admini- stration	17	480.-	8,160.-
5.	Aid, office main- tenance, general services	42	240.-	10,080.-
	Total	80	x	39,960.-
6.	Social charges 15.4 .			5,015.2
	Total			45,075.2

7.5.2. It is assumed that board of directors (5 persons + 1 secretary) will function during exploitation period. Board of directors yearly cost is estimated to be 6 mln FCFA.

#### 7.5.3. Foreign assistance

3 permanent experts at 2 million CFA/month, yearly  
72 million CFA                            ~~6.180.000~~

#### 7.5.4. General administration

We employ the similar methodology to derive the figure for general administration as in the case of Nigeria. The estimate for general administration is therefore equal to 3 % of the yearly salary fund excluding social charge, foreign assistance and Board of Directors.

The total salaries and wages fund (see table 8.2.2)=

	= 292.600 mln CFA
Foreign assistance (point 7.5.3.)	= -72.000 " "
Board of Directors (point 7.5.2.)	= - 6.000 " "
	<hr/>
	214.260 mln CFA

3 % of 214.26 mln CFA = 6.3 mln CFA

#### 7.5.5. Insurance fees and finance costs

0.3 % of the cost of machinery and equipment

0.3 % of 12,477.2 = 37.432

#### 7.6. Service cost centers

##### 7.6.1. Current equipment maintenance and spareparts

Year of production	% of equipment value	Costs 10 <sup>6</sup> CFA
1	1 %	124.8
2 and following	1.5 %	187.2

7.6.2 Major tank furnace maintenance and spare parts

12.5 % of machinery and equipment	= 1,559.6
50 % of costs of erection	= 1,247.5
	<hr/>
	2,807.1

Estimated cost of the tank furnace = 2,807.1

Amortised 50 % over the period of 4 years

$$\frac{50 \% \times 2,807.1}{4 \times 100} = 351 \text{ million FCFA}$$

The estimated foreign/local proportion:

35 % FC = 122.8 million FCFA

65 % LC = 228.2 million FCFA

3.7. Overheads summary table

$10^3$  CFA

Supervision of electric power generators, pump, etc.	6	6	6	6	24
Total	106	101	80	78	365

### S.2. Cost of manpower

Under the assumption of a continuous production process and four shifts work the total employment is assumed to be 445 persons. Functions, salaries and wages are shown in the following table.

#### 8.2.1. Estimate of production costs: salaries and wages

Nigeria N						
Item	Function	Number of persons	Annual salary/ wage	FC	LC	Total
1.	Foreign permanent experts	3	46,000	138,000	-	138,000
2.	Board of directors	5	12,000	-	60,000	60,000
3.	General director	1	21,000	-	21,000	21,000
4.	Deputy directors	5	14,000	-	70,000	70,000
5.	Technical and engineering supervision	15	4,000	-	60,000	60,000
6.	Administration general	17	2,800	-	47,600	47,600
7.	Aid, office maintenance and general services	42	1,600	-	67,200	67,200
8.	Workers - direct labor	365	2,400 <sup>x)</sup>	-	876,000	876,000
	Total	445+81	x	138,000	1,201,800	1,339,800

<sup>x)</sup> At the prefeasibility stage it is assumed that yearly average wage of direct labor is 2400 N without differentiating among different responsibilities levels.

8.2.2. Estimate of production costs:

salaries and wages

Item	Function	Number of persons	Annual salary	N i g e r			$10^3$ CFA
				FC	LC	Total

## IX. PROJECT IMPLEMENTATION

### 9.1. Costs of the project implementation

The project implementation phase embraces the period from the decision to invest to the start of commercial production. It includes a number of stages including negotiation and contracting, project design, construction and the test production.

The construction and equipment erection is assumed to be 30 months including the test of equipment.

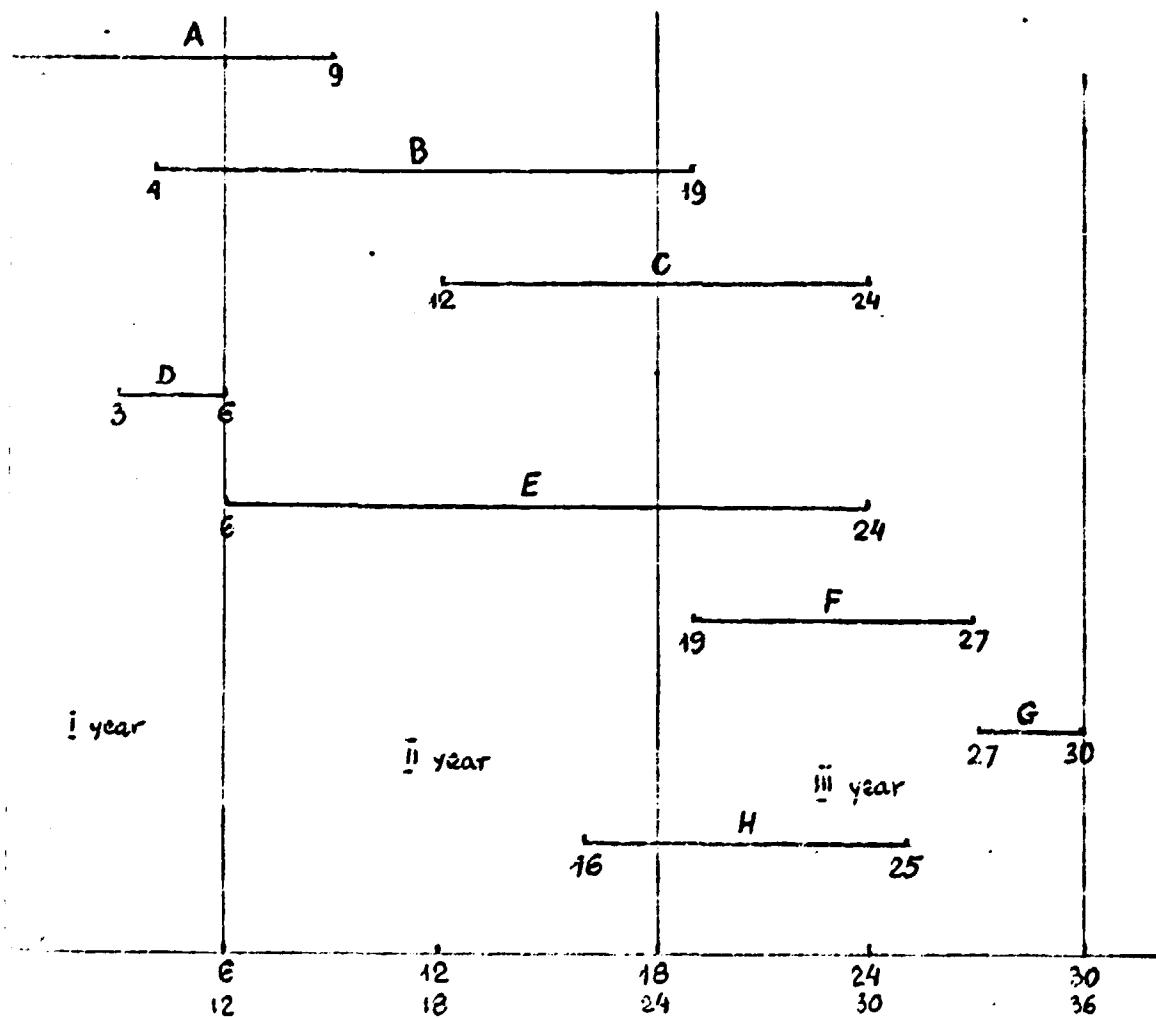

The whole implementation period is assumed to be 36 months, 6 months of implementation, planning, negotiating and contracting included.

The first 3 months of the start up production is assumed to be at 50 % of the production capacity and the remaining 9 months at 90 % of the full capacity. This results in an average 76.5 % production programme for the first year of operation.

The project implementation is proposed to organized according to the following schedule.

Schedule of the project implementation  
(effective action)

- A. Preparation of technical documentation
- B. Production of machinery equipment
- C. Delivery of machinery and equipment
- D. Land and site development
- E. Civil buildings and engineering works
- F. Erection of machinery and equipment
- G. Start-up and commissioning of the plant
- H. Training of the client's staff and laborers
- I. Planning the implementation 1-6 months.

9-2 Estimate of investment costs: project implementation - Nigeria

10-3/1. Calculation of working capital

I. Minimum requirements of current assets and liabilities.

a) Receivables            30 days at production cost  
                            minus interest and depreciation

1. Inventory

local raw materials	30 days
imported raw-materials	90 days
spare parts	180 days
work in progress	0 -
finished products	15 days at factory cost + administrative overheads
c, Cash in hand	5 days <sup>x)</sup>
d) Payables	30 days for raw materials and utilities.

Note: Cash in hand assumed to be 5 days is rather low.

This value is the intermediate result obtained  
in course of approximation of interest costs  
before working capital was known. This assumption  
does not affect important conclusions of the study.

II. Annual production cost estimate

Period	10 <sup>6</sup> CFA			
	Construction		Start up	Ful capacity
Year	1	2	3	4

Equity capital: approximately 30% of the total investment

cost i.e. 10,000 million CFA

share promoter 80 % 8,000 million CFA

share collaborator 20 % 2,000 million CFA

Supplier's credit: approximately 75 % of value FOB of machinery and equipment: 9,300 million CFA; seven years credit, 14 half yearly installments, interest 8 % p.a. (Polimex-Cekop, Poland)

Commercial loan: for working capital, one year credit, interest 15.5 % p.a. (Banque de Developpement de la Republique du Niger)

Financial institutions: 7 years credit, 14 half yearly installments 13 % interest p.a. (source as above)

Current liabilities: distributed between FC and LC by using ratio of PC in working capital (schedule 10-8/1).

$$\text{Pay back period}^{(1)} = 8.7 - 3 = 5.7 \text{ (Pay back period}^{(2)} = \\ = 8.5 - 3 = 5.5 \text{ years}$$

Simple rate of return, year 5 (Full capacity)

$$R_5 = \frac{\text{Gross profit}}{\text{Tot.inv.outlay}} = \frac{1868}{32687} = 5.7\%$$

$$R_5 = \frac{\text{Net profit + depreciation}}{\text{Tot.inv.outlay}} = \frac{4255}{32687} = 13.0\%$$

$$R_5 = \frac{\text{Net profit}}{\text{Equity}} = 18.60\%$$

Break even and sensitivity analysis of the project in  
Liber.

The glass production technology requires the plant to operate on the continuous basis. This situation makes the problem of qualification of various items in the total cost of production difficult. For the purpose of the break even analysis it is however needed to qualify different costs to two classes of fixed and variable costs.

The following division of costs should be perceived as-  
to some extent - arbitrary although will help to give  
an idea about the economic safety margin for the project.

Variable operating costs at full capacity  $10^6$  CFA -

schedule 10-3/1 -

- raw materials

local	418.730
imported	1,032.201
- labour	202.131
- utilities	5,546.220
- sales and distribution	132.565
	<hr/>
	7,381.897

Fixed costs:

- administrative overheads	166.807
- maintenance	137.000
- repairs of tank furnaces	351.000
- financial costs (average) for first 10 years of operation (table 10-12)	1,193.480
- depreciation	2,386.550
	<hr/>
	4,235.037

number of bottles produced at full capacity: 137<sup>6</sup> pieces

	number	percentage	unit price CFA
- beer	- 22.856	16.70	120
- soft drink	114.278	83.30	104
<b>total</b>	<b>137.134</b>	<b>100</b>	<b>x</b>

Unit selling price of an "average bottle"

$$\text{price} = 0.167 \times 120 + 0.833 \times 104 = 106.7 \text{ CFA/bottle}$$

The unit variable cost of production:

$$V = \frac{7,331.397}{137,134} = 53.83 \text{ CFA/bottle}$$

Production cost equation is therefore:

$$y = 53.83 + 4,285.037$$

The sales revenues equation is:

$$y = 106.7 X$$

The break-even production level is:

$$X = \frac{4,285.037}{106.7 - 53.83} = 81.048 \text{ million pieces}$$

or 59.10 % of the full capacity.

The break-even price at full capacity can be derived from the following equation:

$$137.134 \times \text{price} = 53.83 \times 137.134 + 4,285.037$$

$$\text{price} = 85.08 \text{ CFA/bottle}$$

The price safety margin:

$$\frac{106.7 - 85.06}{106.7} \times 100 = 20.26 \%$$

From the above analysis an optimistic conclusion can be drawn concerning the location of the plant in Niger. Both the capacity and price safety margin are more than reasonable.

A. NATIONAL ECONOMIC PLANNING - NIGER

11.1. Job creation, specific capital requirements

$$\frac{\text{total initial investment cost}}{\text{total employment}} = \frac{32,687.3 \times 10^6 \text{ CFA}}{445 \text{ persons}} =$$

$$= 73.455 \times 10^6 \text{ CFA or } 183,613 \text{ } \beta / \text{job}$$

$$\frac{\text{Foreign exchange investment costs}}{\text{total employment}} = \frac{20,004.4 \times 10^6}{445} =$$

$$= 44.954 \times 10^6 \text{ CFA or } 112,384 \text{ } \beta / \text{job}$$

Foreign exchange investment costs constitutes 61 %  
of the total investment costs.

11.2. Foreign exchange savings

• Import substitution:

3.5 % of total production is supposed to be sold in  
home market e.i.  $137.134 \times 10^6 \times 0.035 = 4.3 \times 10^6$   
bottles.

Combined price paid in 1983 for an average bottle was:

$$0.167 \times 120 + 0.833 \times 104 = 106.672 \text{ CFA/bottle}$$

$$\text{Import substitution} = 4.3 \times 10^6 \times 106.672 = 512.026 \times 10^6 \text{ CFA or } 1.28 \times 10^5 \text{ } \beta.$$

Export

96.5 % of total production is supposed to be sold  
abroad (Nigeria) e.i.  $137.134 \times 10^6 \times 0.965 =$   
 $= 132.374 \times 10^6$  bottles.

$$\text{Combined export price} = 0.167 \times 0.25 + 0.833 \times 0.20 = \\ = 0.20601 \text{ } \beta/\text{bottle}$$

Export value = 132.384 x  $10^6$  x 0.20501 = 27.150 x  $10^6$  ₣  
or 35.296 x  $10^6$  ₣ or 14,107.6 x  $10^6$  CFA.

Depreciation = 1,460.552 x  $10^6$  CFA on the foreign exchange  
part of capital.

Interest (average for the first 10 years of operation)  
= 1,193.48 x  $10^6$  CFA

Current imports:

raw materials	1,082.201 x $10^6$ CFA
utilities:	5,546.220 x $10^6$ CFA
tank furnaces repair:	122.800 x $10^6$ CFA
spare parts:	187.200 x $10^6$ CFA
	<hr/>
	6,938.421 x $10^6$ CFA
overheads foreign:	194.000 x $10^6$ CFA
	<hr/>
current imports:	7,132.421 x $10^6$ CFA

Foreign exchange savings summary in  $10^6$  CFA

Import substitution 512.026

Export 14,107.600

Depreciation - 1,460.553

Interest - 1,193.480

Current imports - 7,132.421

$$14,619.626 - 9,736.453 = 4,883.173$$

or 11.600 x  $10^6$  ₣

11.5. Cost/benefit evaluation

Revenue	14,629 x 10 <sup>6</sup> CFA
Social operating costs (10 <sup>6</sup> CFA)	
80% of imported raw materials:	865.760
60% of utilities:	3,327.732
50% of labor:	101.091
50% of administration	83.404
30% of distribution costs:	119.309
	<hr/>
	4,497.296 - 4,497.296
	<hr/>
	10,131.704
Depreciation:	- 2,386.555
	<hr/>
	7,745.149

Social Rate of return

$$\frac{7,745.149}{0.61 \times 32,657} \times 100 = 38.72 \%$$

S U M M A R Y

A. Internal rate of return (IRR) = 12.73 %

Calculated for a period of 10 years of production.

B. Pay back period 5.7 years.

C. Rentability of capital: (1/7.5) of cumulated net results of the first 5 years of exploitation divided by value of capital = 11.65 %.

D. Rentability of investment: (1/7.5) of cumulated net results over the first 5 years of production divided by total investment costs excluding working capital: 3.66 %.

E. Simple rate of return: net profit/sales; average of the first 5 years of production: 11.62 %.

Calculation of A-E does not take into consideration inflation. Inclusion of inflation will result in higher values of parameter due to a significant portion of external financing within the project.

X. FINANCIAL AND ECONOMIC EVALUATION - NIGERIA

10.1.1. Initial fixed investment costs

Item	Investment category	FC	LC	Total
1.	Land: plot of 5.7 ha, the rent paid during 3 years of construc- tion		90,000	90,000
2.	Site preparation and development: surfa- cing, clearing, leve- ling and fencing at the rate of 4.5 ₦/Sq.m. x 5.7 ha		256,500	256,500
3.	Structures and civil works	6,249,000	12,758,500	19,007,500
4.	Incorporated fixed assets			
5.	Plant machinery and equipment	30,208,000	5,397,000	35,605,000
	Total:	36,457,000	18,502,000	54,959,000

Table 1 - Capital costs

	1970 £	1971 £	1972 £	1973 £	1974 £
Plant & equipment	1,000,000	1,000,000	1,000,000	1,000,000	1,000,000
Site preparation and development	100,000	100,000	100,000	100,000	100,000
Structure site	100,000	100,000	100,000	100,000	100,000
Civil works	100,000	100,000	100,000	100,000	100,000
Incorporated labour assets	100,000	100,000	100,000	100,000	100,000
Plant and equipment	1,000,000	1,000,000	1,000,000	1,000,000	1,000,000
Total	1,000,000	1,000,000	1,000,000	1,000,000	1,000,000

Note : The capital costs estimated above do not include the tank finance charges which are included under overhead costs of production.

#### 10.3.1. Calculation of working capital

##### I. Minimum requirements of current assets and liabilities

a) Accounts receivables 30 days at production costs  
minus depreciation and interests

b) Inventory

Local raw materials 30 days  
(sand and limestone)

Imported raw materials 90 days  
(remaining)

Spare parts 180 days

Work in progress 0 days

Finished products 15 days at factory costs plus  
administrative overheads

c) Cash in hand 12 days

d) Accounts payable 30 days, for raw materials and  
utilities.

III. Annual production-cost estimate

Period	Construction			Start-up		Full capacity	
	1	2	3	4		5 and following	
Year							
Production programme				76.5 % <sup>x)</sup>		100 %	
Costs:							
Raw materials							
Local				1,722,614		1,914,015	
Imported				3,479,229		3,865,810	
Labour				876,000		876,000	
Utilities				2,632,635		2,925,150	
Repair (tank furnaces)				674,750		674,750	
Maintenance							
Spare parts				239,900		359,800	
Factory costs				9,625,128		10,615,525	
Administrative overhead costs				618,054		618,054	
Sales and distribution costs: 0.5 % of a yearly revenues (N 23,144,200)				107,625		140,721	
Operating costs				10,350,834		11,374,300	
Financial costs (interest)				4,194,563		3,767,54	
Depreciation				4,545,250		4,545,250	
Production costs				19,090,667		19,687,090	

x) Note: The first 3 months production operates at 50 % of the full capacity and the remaining 9 months at 90 % of the full capacity. Raw materials and utilities requirements are assumed to be at the same time 90 % of the yearly requirements, due to an excess of cullot.

10.3.2. Calculation of working capital

X = minimum days of coverage

Y = coefficient of turnover

Item	X	Y	Start-up	Full capacity
			year	10 <sup>3</sup> N
			4	5
I. Current Assets				
A. Accounts receivables	30	12	862.368	947.595

10.8.1. Sources of finance

$10^3 \text{ ₹}$

Item	Source of finance	LC	FC	Total
1.	Promotors			
	a) Equity (80 %)	14,400.0	-	14,400.0
2.	Collaborators			
	a) Equity (20 %)	3,600.0	-	3,600.0
3.	Financial institu- tion loans	4,739.922	18,758.9	23,498.322
4.	Commercial loans	1,144.647	1,066.452	2,211.099
5.	Supplier's credit		17,995.5	17,995.5
6.	Current liabilities	375.667	340.748	725.415
		24,260.236	38,170.60	62,430.836

Comments on sources of finance

equity capital: 18,000,000 N i.e. approximately  
30 % of the total investment cost.

The share in equity: promoter 80 % = 14,400,000  
collaborator 20 % = 3,600,000

Supplier's credit: 75 % of the value of machinery and  
equipments;  
75 % of 23,954,000 = 17,995,500  
seven years credit 14 half-yearly  
installments, interest 8 % p.a.

Commercial loans: short term credit for working capital,  
one year credit, interest 13 % p.a.

Financial institution

loan: seven years credit, 14 half-yearly  
installment, interest 10 1/2 % p.a.

Note: Current liabilities distribution was made by using the  
ratio of FC share in working capital (schedule 10.6.1.).

SECTION 2

Pay back period calculation

Calculation of ("Profit")

Description/Year	4	5	6	7	8	9	10	11	12
Net profit	1341.8	4651.4	4958.5	5265.6	5572.3	7529.9	6187.0	614.1	6723.5
Interest	4194.6	3767.5	3209.1	2650.7	2093.3	1535.9	975.5	417.1	-
Depreciation	4545.3	4545.3	4545.3	4545.3	4545.3	4545.3	4545.3	4545.3	4545.3
("Profit")	10081.7	12964.2	12712.9	12641.6	12210.9	13609.1	11707.3	11456.5	11268.8

Year	A. Calculation of pay-back period		Balance at the end of year	
	Amount paid back ("Profit")	Value <sup>(1)</sup>	59424.3 <sup>(3)</sup> = Value <sup>(1)</sup> - Land and working capital	
1	-			
2 Construction	-			
3	-			
4	10081.7	51623.7	41412.6	
5	12964.2	38659.5	23448.4	
6	12712.9	25946.6	15735.5	
7	12641.6	13305.0	3093.9	
8	12210.9	1094.1	- 9117.0	
9	13609.1	-12515.0		
10	11707.8			
11	11456.5			
12	11268.8			
13	11262.8			

Pay-back period<sup>(1)</sup> = 8.08 years - 3 years of construction =  
 = 5.08 years

Pay-back period<sup>(2)</sup> = 7.25 years - 3 years of construction =  
 = 4.25 years

$$I \quad R_{(5)} = \frac{\text{Gross profit}}{\text{Total inv.outlay}} = \frac{8457.1}{61705.4} = 13.7\%$$

$$R_5 = \frac{\text{Net profit + depreciation}}{\text{Tot. inv. outlay}} = \frac{4651.4 + 4545.3}{61705.4} =$$

$$= \frac{9206.7}{61705.4} = 14.9\%$$

$$II \quad R_{e5} = \frac{\text{Net profit}}{\text{Equity}} = \frac{4651.4}{13000.0} = 25.3\%$$

Break even and sensitivity analysis of the project in  
Nigeria

The methodology and assumptions needed here are the same as adopted for Niger (see page 139).

Qualification of costs of production based upon the schedule 10.3.1.

Variable operating costs:

	$10^3 \text{ N}$
- raw materials	
local	1,914.015
imported	3,865.810
- labor	876.000
- utilities	2,925.150
- sales and distribution	<u>140.721</u>
	<u>9,721.666</u>

Fixed costs:

- administrative overheads	618.054
- maintenance	359.300
- repairs of tank furnaces	674.750
- financial costs	1,884.070
average for the first 10 years of operation	
- depreciation	<u>4,545.250</u>
	<u>8,081.924</u>
	<u>17,803.620</u>

The unit selling price of "average bottle"

	number	percentage	unit price N
- beer	20.000	16.70	0.23
- soft drink	114.000	83.30	0.20
number in 10 <sup>3</sup> pieces			

Unit selling price of an average bottle equals to  
0.20501 ₦.

The unit variable cost of production:

$$v = \frac{9,721.696 \times 10^3 \text{ ₦}}{137.134 \times 10^6 \text{ pieces}} = 0.07891 \text{ ₦/bottle}$$

The production cost and sales revenues equations:

$$y = 0.07891 \times X + 3,081.924$$

$$y = 0.20501 \times X$$

The break even production level is:

$$X = \frac{3,081.924 \times 10^3 \text{ ₦}}{(0.20501 - 0.07891) \text{ ₦/pc}} = 64.091 \times 10^3 \text{ pcs}$$

or 46.73 % at the full capacity

The break even price at full capacity:

$$137.134 \times 10^6 \times \text{price} = 0.07891 \times 137.134 \times 10^6 + \\ + 3,081.924 \times 10^3$$

$$\text{price} = \frac{17,803.620 \times 10^3}{137.134 \times 10^6} = 0.1293 \text{ ₦/bottle}$$

The price safety margin:

$$\frac{0.20501 - 0.1293}{0.20501} \times 100 = 36.69 \%$$

Both the capacity and price safety margins represent favourable situation of the project located in Nigeria.

S U M M A R Y

A. Internal Rate of Return (IRR) = 14,146 %

B. Pay-back period: 5.0 years

C. Rentability of capital: 1/7.5 of cumulated net results over the first 5 years of production divided by equity value: 16.14 %

D. Rentability of investment: 1/7.5 of cumulated net results over the period of first 5 years of production divided by total investment costs excluding working capital: 4.38 %

E. Simple rate of return: the first 5 years of net profit divided by first five years sales: 16.24 %

Calculations of A through E does not take into consideration inflation. Inclusion on inflation will, however, result in higher values of the above mentioned parameters due to important portion of external financing within the project.

## II. NATIONAL ECONOMIC BENEFITS - NIGERIA

### II.1. Job creation, specific capital requirements

$$\frac{\text{Total initial investment}}{\text{employment}} = \frac{61,705.421 \times 10^3 \text{₦}}{445 \text{ persons}} =$$

= 132.664 ₦/job or 130.263 £ / job

$$\frac{\text{Foreign exchange investment}}{\text{employment}} = \frac{37,820.852 \times 10^3 \text{₦}}{445 \text{ persons}} =$$

= 84,990 ₦/job or 110,483 £ / job

The share of foreign exchange part constitutes 61,3 % of total initial investment.

### II.2. Foreign exchange savings

#### Import substitution:

96.5 % of total production is assumed to be sold in the home market s.i.  $132.334 \times 10^6$  bottles at a combined (weighted by structure of beer and soft drinks bottles) price of:

$$0.167 \times 0.23 + 0.833 \times 0.20 = 0.20501 \text{₦ / bottle}$$

$$\begin{aligned} \text{Import substitution value} &= 132.334 \times 10^6 \times 0.20501 \\ \text{₦/bottle} &= 27.130 \times 10^6 \text{₦ or } 35.269 \times 10^6 \text{£} \end{aligned}$$

#### Export:

3.5 % of total production is supposed to be delivered to Niger, s.i.  $137.134 \times 10^6 \times 0.035 = 4.8 \times 10^6$  bottles at a combined price:

$$0.167 \times 120 + 0.833 \times 104 = 106.672 \text{CFA/bottle or } 0.20501 \text{₦/bottle.}$$

$$\text{Export value} = 4.8 \times 10^6 \times 0.20501 = 0.964 \times 10^6 \text{₦}$$

Depreciation on the foreign exchange part of investment  
 $0.613 \times 4,545.250 \times 10^3 \text{ N} = 2,736.238 \times 10^3 \text{ N}$

Interest (average for the first 10 years of operation)  
equal to  $1,884.070 \times 10^3 \text{ N}$

Current imports:

raw materials	$3,365.810 \times 10^3 \text{ N}$
utilities	-
tank furnaces repair	$236.162 \times 10^3 \text{ N}$
snare parts	$359.800 \times 10^3 \text{ N}$
	<hr/>
	$4,461.772 \times 10^3 \text{ N}$
overheads foreign	$374.162 \times 10^3 \text{ N}$
	<hr/>
current imports	$4,835.934 \times 10^3 \text{ N}$

Foreign exchange savings summary (in  $10^6 \text{ N}$ )

Import substitution	27.130
Export	0.935
Depreciation	- 2.736
Interest	- 1.284
Current imports	<hr/>
	23.115

$$23.115 - 9.506 = 13.609$$

Foreign exchange savings equals to  $13.609 \times 10^6 \text{ N}$  or  
 $24.192 \times 10^6 \text{ N}$

iii. Cost/benefit evaluation ( $10^3 \text{ N}$ )

Revenue	28,144.2
Social operating costs:	
80 % of imported raw materials	3,092.7
50 % of utilities	2,419.6
50 % of administration	309.0
50 % of labor	438.0
50 % of distribution costs	<u>70.4</u>
	<u>6,329.4</u>
	<u>- 6,329.4</u>
	21,814.8
Depreciation	<u>- 4,545.3</u>
	17,269.5

Social rate of return:

$$\frac{17,269.5}{0.613 \times 61,705.4} \times 100 = 45.66 \%$$

Analysis of limestone samples

Samples of limestone depicted as Keitha I and Tahoua have been handed to mission from archival collection in Ministry of Geology, Niamey, Niger, with information that they had been collected in Keitha region and Tahoua region.

They can not be taken seriously as representatives of limestone deposits for production purposes, but can be considered as indicative information that there is a possibility to find limestone deposits in the a/m regions.

1. Macroscopic estimation of samples.

Sample Keitha I

Sample in form of snail shell with distinct rusty-brown inclusion in central part. Smooth surface (non porous, firm) bright-white with dark coatings in places.

Sample Tahoua

Sample in form of irregular block with shell shapped fossil distinctly visible on surface of variable intensity of yellow-brown tincture with black coatings in places.

2. Macroscopic estimation of crushed samples.

Sample Keitha I

Sample after comminution and blending shows slightly pink tincture.

Sample Tahoua

Sample after comminution and blending shows white-cream coloured tincture.

3. Chemical composition of samples

	<u>Sample</u> <u>Keitha I</u>	<u>Sample</u> <u>Tahoua</u>
CaO	53.41	53.53
MgO	1.10	0.68
SiO <sub>2</sub>	1.42	1.36
Al <sub>2</sub> O <sub>3</sub>	0.33	0.63
Fe <sub>2</sub> O <sub>3</sub>	1.15	0.393
TiO <sub>2</sub>	0.017	0.027
Na <sub>2</sub> O	0.16	0.18
K <sub>2</sub> O	traces	traces
ignition loss	42.18	42.38
particles non-soluble in HCl	2.35	2.46
humidity	0.51	0.64

Determination of respective oxides have been done using the following methods:

- CaO, MgO - determined by complex titration analysis  
SiO<sub>2</sub>, TiO<sub>2</sub>  
Al<sub>2</sub>O<sub>3</sub>, Fe<sub>2</sub>O<sub>3</sub> - determined by calorimetric analysis  
Na<sub>2</sub>O, K<sub>2</sub>O - determined by flame type photometric analysis

Analysis done by Chemical Laboratory of Glass-works Krosno at Krosno, Poland.
