Training Seminar on  
PREPARATION, EVALUATION AND FINANCING  
of Industrial Projects

TERMINAL REPORT

I. Official Arrangement and Contributors

The training Seminar on Industrial Project Preparation, Evaluation and Financing was sponsored and organized under the joint-auspices of the United Nations Industrial Development Organization in Vienna, the United Nations Development Programme in Havana and the "Comision De Asociaciones Economicas" of Cuba. The lecturers to the workshop seminar were: Messr. O. Heinonen, W. Hübner and T. Gorfaly from UNIDO part and Messr. J. Pacheco and L. Penichet from the Cuban part.

The Government of Cuba nominated 33 participants of senior level from 17 different Ministries and Institutions engaged in industrial projects development. A cross-section of the participants profession is as follow:

Engineers:	10
Engineer-Economist:	2
Economists:	15
Accountant:	1
Foreign Trade spec.:	1
Unspecified:	<u>4</u>
Total:	33

Annexe I presents a list of participants, their field of specialization and the respective institution they are working for.

II. Objectives of the seminar

The main objectives of the seminar were to up-grade the skills of senior personnel in different Ministries and Cuban Institutions in the field of project preparation, evaluation and financing by:

- Presenting and explaining the proven methodology applied by UNIDO in project formulation;
- Training the participants by applying "Case Study".

### 111. Organization and scope of the seminar

UNIDO consultants arrived on Friday April 13 in Havana. On Saturday April 14 a meeting was held with the Cuban responsables to plan and organize the start-up of the seminar. A programme schedule was prepared by the consultants and presented to the Cuban responsables for discussion. Consequently, an initial schedule was established. However, some modifications were introduced during the programme to accommodate different factors affecting the schedule. Annex II presents the programme schedule as implemented.

The workshop seminar started on April 16, 1984 and was concluded on Friday May 4. Lecturing time was on the basis of 2 morning sessions of 1 1/2 hours each and one afternoon session of 2 hours for a daily total of 5 hours excluding coffee-break and lunch time. In addition, Saturday April 21 was included as a lecturing day in lieu of Tuesday May 1 which was an official holiday. In total, 43 lecturing sessions were held (excluding opening and closing ceremonies) totaling 71 1/2 hours.

Repartition of lecturing time on the main topics were as follow:

	<u>No. sessions</u>	<u>No. of hours</u>	<u>% of time</u>
1. Outline of project development cycle	4	7	10%
2. Market study	10	16 1/2	23%
3. Technical analysis	7	11	15%
4. Financial evaluation and project financing	12 1/2	21	30%
5. Economic evaluation	7 1/2	13	18%
6. COMFAR presentation and seminar evaluation	<u>2</u>	<u>3</u>	<u>4%</u>
Total:	43	71 1/2	100%

The seminar was held in a conference room of the Havana Libre Hotel. The services of 3 competent interpreters was made available at all time, securing fast and instantaneous translation. The workshop was conducted by presenting the topic in a lecture fashion mixed with life examples. After presenting the conceptual approach, case studies were introduced as an exercise to the group on the subject presented.

Concerning the market study and the economic evaluation, several cases were introduced, as for the financial analysis, the case study of "Magera fruit processing project" was the basic practical application of the methodology in project evaluation.

For the purpose of applying "case study", the participants were divided into 4 groups headed by 4 team leaders to present the results of each group work. Part of the sessions were used for the practical application by the participants to exercise on the "case study". They were asked to calculate and/or evaluate the data obtained from different tables of the case study. Homework on case study was not favored by the participants as a result of their other obligations.

The participants were given the following items:

- a calculator
- the manual for the preparation of industrial feasibility studies
- the manual for the evaluation of industrial projects
- the guidelines for project evaluation
- the guide to practical project appraisal.

In addition to the above, discounting tables were provided from the consultants to the participants - Annexe III -. In addition to the above, each of the consultant prepared fairly extensive handouts on their respective areas of analysis. These handouts were given to the participants and were supplementary material, delivering conceptual as well as practical aspects on the topic presented. A volume containing this additional material is attached to this report in Annexe IV.

Finally, the consultants together with Mr. Kulczycki of UNIDO, Vienna, went to Cuba 9, where a pilot project producing experimental newsprint from bagasse, is already in existence. There, discussion between Mr. Lopez Guzman and Mr. Kulczycki and the consultants were held to establish the follow-up on a pre-feasibility study for the full scale production of a new factory producing newsprint from bagasse.

#### IV. Evaluation of the seminar

The participants had different background as well as different level of experience. Thus, the lecturers had to adjust their lecturing speed so as not to loose the interest of the experienced group or run the risk to loose the comprehension of the less experienced group. In regards to selecting candidates for similar courses in the future, it is recommended to choose a homogeneous group.

At any time during the sessions, and several times after the sessions, participants were free to raise questions to clarify obscure side of the subject. This created a two ways dialogue helping to maintain the interest and clarifying vague items. Moreover, the consultants kept the interest of the participants by asking them to respond to the lecture questions put during the session and also requested the groups to contribute by verbal presentation on their findings of the "case study" applied.

Attendance to the seminar was at all time above 90% of the total number of registered participants. The main cause of absentism from the seminar was the calls made on some of the participants by their respective institution. A list of presence was kept up-to-date daily.

The language communication gap presented no difficulty at all, as most of the participants understood fairly well the English language and the exceptionally rapid and accurate translation of the interpreters complemented whatever was missed by the participants.

From the questions raised and responses received from the participants and from the discussions held and the practical exercises done, it is clear that within the time limit of the seminar its basic objectives were attained, as:

- the programme has been fully covered,
- case studies were carried out on each topic of a feasibility study,
- additional practical life examples were given.

The great assistance provided by the Cuban responsables in providing all the necessary logistic support (typing facilities, photocopying, blackboard, projector, interpreters, etc.) has greatly contributed to the attainment of the seminar objectives.

The duration of the seminar was considered by several participants as short, considering the load of knowledge presented and its assimilation by applying "case study".

It could be quite beneficial if a case study from the country itself be prepared before the start-up of the seminar and thereafter presented during the seminar.

Finally, each participant who attended more than 80% of the seminar time was given a certificate for having followed the course. The certificates were remitted at the closing ceremony by Mr. Bravo Lopez of the Council of Minister Secretariat.

#### V. Recommendations

- A Case Study proper to the country would be an ideal way to present it as it would fit the local environment. This case study would include all the facets of a feasibility study. This case would be presented as an exercise during the seminar.
- A brief evaluation by the participants at the end of each topic presented is recommended and not merely at the end of the programme. This could help redirect the programme according to the local needs and conditions and not reflecting the results at the end of the seminar when usually it is too late.
- Follow-up procedure to establish further development and training to the local experts.
- To select participants with similar level of preparation and experience so that the presentation of the lecturer be more uniformly comprehended.

VI. Acknowledgement

The UNIDO team is grateful to the "Comision De Asociaciones Economicas" of Cuba for all the facilities and arrangements provided which greatly contributed to the success of the seminar. Also, special thanks are due to all the Cuban responsables who directly or indirectly contributed to the successful conclusion of this seminar.

The team also wishes to express their deep appreciation and thanks to the Resident Representative, his deputy and the JPO for their great assistance and help and for their contribution to its success.

Finally, the consultants present their thanks to Mr. W. Behrens, chief of the Feasibility Studies Section and Mr. M. Kulczycki at UNIDO headquarters in Vienna, who organized this seminar and have through their assistance supervision and guidance contributed to its success and attainment of its objectives.

UNIDO TRAINING WORKSHOP SEMINAR  
IN INDUSTRIAL PROJECT  
PREPARATION, EVALUATION AND FINANCING

Prepared by

T. ORFALY

PROJECT OUTLINE: THE PROJECT CYCLE

(APRIL 16 - MAY 4, 1984)

IN

HAVANA - CUBA

## COURSE OUTLINE

### I. Objectives:

- What is a feasibility study?
  - Feasible under what terms and conditions. Project might be feasible but at a very high cost and risk.
  - What are we attempting to measure: commercial profitability, return versus risk National economic benefit, definition of each of the above.
  - Why feasibility studies are undertaken: knowledge of terms, conditions and risks - to be assured of a certain degree of success if implemented.
  - Developing countries aim at increasing industrial output. Thus studies should keep pace to properly allocate scarce resources. Hence, pre-investment studies are a prerequisite for investment decisions.
  - Pre-investment studies assists in identification and selection of projects.
- ### II. Stages of project preparation:

- How many phases are there before a project be operational? and what kind of studies do we undertake at each phase?
- Pre-investment phase - investment phase - operational phase.

### III Project identification:

#### 1. Preinvestment phase:

- A - Identification of investment opportunities (Project idea) Sketchy in nature (aggregate estimates)

Investment opportunities could be identified by analysis:

- Availability of Natural resources - electricity, oil, wood based industries.
- Existing agricultural products that could serve as basis of agro-industry.
- Import to identify import-substitution products.
- Manufacturing sectors successful in other countries at same level of development.
- Possible interlinkage with other industries.
- Possible integration of existing line of manufacturing such as petrochemical industry for a refinery.
- Possible diversification (pharmaceutical), horizontal expansion
- Expansion or modernization of existing facility to cover market.

- Government industrial policies.
- Export possibilities.
- a) General opportunity studies are 4 types:
  - i) Area studies: region or area
  - ii) Subsectorial studies: Building materials, food processing
  - iii) Resource-based: Aluminium, petrochemical
  - iv) Need-based: Interlinked with other project.
- b) Specific project opportunity studies, transformation of a project ideas into investment proposition to interest investor (project profiles). (Cost limited .2% to 1% of total project cost, precision  $\pm$  40%).

The larger the required investment cost and the complexity of the project, the greater the need to deepen the study to feasibility one.

#### B. Pre-feasibility studies.

Intermediate stage between opportunity and feasibility study.

Same structure than feasibility with less details. It can also be by-passed. If doubtful project pre-feasibility necessary. (Cost .25% to 1.5% of total project cost (Precision  $\pm$  20%).

#### C. Support studies:

They cover one or more aspects but not all aspects of investment opportunities.

1. Market studies
  2. Raw material and inputs studies (price, Trend, substitutes)
  3. Location studies (transport cost)
  4. Laboratory studies (suitability studies of raw materials).
  5. Economics of scale studies (Technology, size). Structure of operating costs.
  6. Equipment selection studies (equipment identification - bid preparation, mecanized, semi-mecanized, manual versus maintenance).
- Their content varies and they become part of future studies.

- They are undertaken before a feasibility or prefeasibility.
- They are also undertaken after the feasibility due to change.
- Small in size in relation to feasibility.

D. Feasibility studies:

Must provide technical, economic and commercial information with possible alternatives, drawings, tables, sketches by a team of experts.

Should provide a project of a defined production capacity at a selected location, using particular technology in relation to defined materials and inputs at identified investment and production cost, and sales revenues yielding a defined return.

- A large puzzle where each piece must fit its place and the whole unit provide a good picture.
- Scope should be defined.
- Full coverage with emphasis on different aspects depending on project.
- Feedback interlinkage describing the optimization process.
- Derived from demand or available input (Market or resources base)
- Not an end in itself but to arrive at an investment decision, which decision may differ from study.  
(Cost 1% to 3% small project, .2% to 1% large industry  
(Precision  $\pm$  10%).

E. Evaluation and decision stage (Evaluation report).

2. Investment phase:

- A Negotiation (joint venture, legal status of establishment) and financing line-up.
- B Project design and contracting stage.
- C Construction stage and manpower training.
- D Commissioning stage.

3. Operational phase:

The pre-investment phase determines the ultimate success or failure of an industrial activity. The pre-investment studies are the sub-structure if solid then upper structure will hold.

### Feasibility Study Scope:

Scope of study coverage must be clearly defined. Should include production cost related to supply inputs, delivery of outputs.

Includes all activities necessary to the survival of project e.g. extraction and off-site transport, storage, delivery, housing, recreational (agro industry and marble case).

- Should cover preceding and succeeding stage of the project production process.
- Divide the project into component (production, transport, assembly, painting, finishing etc.) cost centers.

### Limitations:

All data are not always available hence assumptions have to be made.

Available data from:

1. call for tenders
2. similar project
3. unit cost parameters from comparable operating project
4. Lump-sum cost for group of equipment based on comparable project.

(3 and 4) should be

- adjustment for inflation
- exchange rate changes
- difference in local condition
- difference in law and regulation

Other source reference:- Industrial association, equipment manufacture (case cement project), development banks, International Organization Care in their application due to their rate of collection, plant size, country of origin.

### Definition:

Capacity is defined as a measure of output in an agreed period of time. Measuring the output could be unit/hour or unit/month or unit/year. Monthly and yearly are not the result of simple multiplication of the hour output. Thus the following definition:

- Installed capacity = nominal output of units per hour
- Nominal maximum capacity = unit/hour output x time.

- Feasible normal capacity = uni./hour output x feasible time  
(which is time minus maintenance, repair, breaks, holidays, snafus, tool changes etc.)
- Statistical capacity = empirically proven.
- Local and Foreign exchange:  
Most project require local and foreign exchange. Thus it is necessary that all the project cost be converted into an agreed governing currency.
- Contingency: Two Types: 1. physical, 2. Financial (escalation cost).
  1. Physical = for raw material, utility, manpower, sales etc.
  2. Financial = For investment cost, production cost and sales.
- Different contingency rates for different items (imported local).
- Accuracy of investment and production cost estimates increase as from one stage to the next.

Project team: To cover major substantive fields of project: For a large project would require for example the following multidisciplinary Team:

- One industrial economist
- One market analyst
- One or more Technologist/engineer specialized in the project
- One mechanical engineer
- One civil engineer
- One financial analyst
- Plus land surveyor, soil expert, laboratory expert.

Characteristics of an Acceptable Feasibility Study:

1. Measurability of results
2. Clarity of concepts and criteria
3. Comprehensive in composition

4. Integrated in structure
5. Dependability of information inputs
6. Consistency of compositions and conclusions
7. Updated data base
8. Selectivity in considering alternatives.

What is a Project:

It could be: New project, expansion, diversification, change in technology, change in material, change in location, modernisation, new shift work.

Studies apply not only to new project but also to the above.

For expansion project:

Compare the projected financial results of the expansion to the existing facility projected results to find out the viability of the new proposed expansion vis-a-vis the existing one.

What is project planning?

Planning investment decisions on:

1. What to produce
2. How much to produce
3. Where to produce
4. How to produce
5. How to distribute
6. How to finance
7. How to manage.

Decisions on alternatives of Product and product mix could cover:

Size

Location

Technology

Method of financing

Market segment

Organizational structure

Implementation programme.

\*\*\*\*

Introduction to Industrial Project Preparation and Evaluation

What does a feasibility study comprise

I. Project Background and History.

- A - Project background
- B - Sponsor/promoter
- C - Project history
- D - Executive management list
- E - Agreement and License.

II. Demand and Market Analysis

- A - Manufacturers' criteria for a New Product
- B - Market assessment
  - 1. Product characteristics
  - 2. Product classification
  - 3. Price level and trends
  - 4. Government policies
  - 5. Channels and distribution
  - 6. Market supply
  - 7. Market demand
  - 8. Content of demand analysis.
- C - Sales forecasting methods
  - 1. Trend extrapolation
  - 2. Consumption level method (income and price elasticity of demand)
  - 3. End-use (consumption coefficient)
  - 4. Regression models
- D - Market Surveys
- E - Estimates Sales Revenues.

### III. Production Programme

Place of the production programme in the over-all industry development programme

Data required to set up production programme

Constraints and options

- sales
- storage requirements
- operational

Selection of the production programme

Time schedule of production

- initial
- operational

Wastes and effluents as limits of production programme

- quantities
- quality
- treatment

Which way the economical feasibility is affected by the production programme

### IV. Plant Capacity

Definitions

Factors differentiating maximum and feasible capacity

Time dependence of the plant capacity

Constraints and options of the plant capacity

- market build-up
- raw materials availability
- supply schedule of raw materials
- step-wise development of the plant capacity

Influence of the technology and equipment on plant capacity

Size-cost relation of the equipment and installations

Procedures of size-cost estimate

Adjustment of the plant capacity to the production outputs

V. Materials and Inputs

A - Characteristics of materials and inputs

1 - Classification

2 - Data and alternative

3 - Selection and description of materials and inputs

B - Supply programme

1 - Fundamental data and alternatives

2 - Considerations when setting supply programme

C - Selection of supply programme

D - Cost estimates

VI. Project Layout - Technology and Engineering

Project layout-preliminary project

Types of project layouts and their functions

General functional layout

- site arrangement

- equipment arrangement

Material flow diagram

Material balance

Production process diagram

Utility consumption diagram

Telecommunication and electricity diagrams

Organisation charts

Technology

Definitions

Resources of technology

- research
- aquisition

Comparative study on technology

Selection of the technology

- parameters of technology
- means of aquisition and contract structure
- cost-preliminary estimate

Engineering and equipment purchasing

- engineering drawings and specifications
- selection of the equipment
- cost estimate of equipment

Civil engineering

Classification of the civil engineering

- site preparation
- outdoor installations engineering
- buildings and constructions
- special civil works

- Cost estimate

#### VII. Plant Organization and Overhead Costs

A - Cost centers

B - Overhead costs

VIII. Manpower

Purposes of manpower planning

Classification of production Labor

Labor estimates

- sources of information

- engineering methods of labor demand estimate

Training

Local and foreign personnel - selection of personnel

Training and productivity standards

Scheduling of the manpower

Estimates of labor cost

Surcharges on salaries and wages

Administrative and management cost

IX. Location and Site

A - Location

1 - Data and alternatives

2 - Choice of location

B - Sites

1 - Data and alternatives

2 - Site selection

3 - Cost estimate

C - Local conditions

D - Environmental impacts

X. Implementation Schedule

Stages of the implementation of the project

- preconstruction

- construction

- plant commissioning

Purchase of the equipment  
Detailed engineering  
Contracting civil works  
Arrangements for financing  
Construction programme  
Scheduling methodology  
Control methods of schedule implementation

XI. Financial and Economic Evaluation

- A - Estimated fixed investment cost and pre-operation cost
- B - Estimated initial working capital requirements
- C - Sources of financing
- D - Capital structure
- E - Annual production cost
- F - Net income statement
- G - Sources and uses of funds for financial planning
- H - Proforma balance sheet for financial planning.
- I - Significance and structure of evaluation
- J - Financial evaluation: Ratios (debt/equity, profitability, debt-service coverage)
- V - Financial evaluation: cash flow N.P.V., I.R.R., Payback period
- L - Financial evaluation under uncertainty
- M - Sensitivity analysis
- N - Principles of social benefit cost analysis
- O - Economic evaluation: Value added
- P - Economic evaluation: Pricing rules
- Q - Economic evaluation: Employment generation
- R - Economic evaluation: Foreign exchange savings
- S - Economic evaluation: Income distribution
- T - Economic evaluation: Additional criteria
- U - Economic evaluation: Supplementary considerations.

INVESTMENT  
PROJECT DEVELOPMENT  
CYCLE

PHASE I

PRE - INVESTMENT

INVESTMENT

PHASE III

OPERATION  
/PRODUCTION/

# PROJECT DEVELOPMENT CYCLE

PRE-INVESTMENT PHASE				INVESTMENT PHASE			OPERATION PHASE
Identification of investment opportunities (Project ideas)	Preliminary selection stage (Pre-feasibility study)	Project formulation stage (Techno-economic feasibility study)	Evaluation and decision stage (Evaluation report)	Negotiation (CREDIT ARRANGING, LEGAL FORMATION OF ESTABLISH ETC.) FINANCING LINE UP.	Project DESIGN AND CONTRACTING STAGE.	Construction stage	Start-up stage

Investment promotion activities

Implementation planning and follow-up

Capital investment expenditures

## TYPES OF DECISIONS TO BE TAKEN DURING DIFFERENT PRE-INVESTMENT STAGES

DECISION	ANALYSIS TOOL STUDY	DECISION GOAL
Identification	General or project opportunity studies	Identify opportunity Determine critical area for support studies Determine area for pre-feasibility or feasibility studies
Preliminary analysis	Support studies	Determine which of possible choices is more viable Identify the choice of project criteria
	Pre-feasibility studies	Determine provisions viability of the project Appraise if the feasibility study should be launched
Final analysis	Support studies	Investigate in detail selected criteria requiring depth-study
	Feasibility study	Make the final choices project characteristics Determine the feasibility of the project and select criteria
Project evaluation	Evaluation study	Make final investment decision

MAIN HEADINGS OF THE CONTENT OF A FEASIBILITY STUDY

1. EXECUTIVE SUMMARY

2. PROJECT BACKGROUND AND HISTORY

3. MARKET AND PLANT CAPACITY

DEMAND AND MARKET STUDY

SALES AND MARKETING

PROJECTION PROGRAMME

PLANT CAPACITY

4. MATERIAL INPUTS

MATERIALS AND INPUTS

SUPPLY PROGRAMME

5. LOCATION AND SITE

LOCATION

PLANT SITE AND LOCAL CONDITIONS

ENVIRONMENTAL IMPACT

6. PROJECT ENGINEERING

LAYOUT AND PHYSICAL COVERAGE OF PROJECT

TECHNOLOGY AND EQUIPMENT

CIVIL ENGINEERING

7. PLANT ORGANIZATION AND OVERHEAD COSTS

PLANT ORGANIZATION

OVERHEAD COSTS

8. MANPOWER

LABOUR

STAFF

9. PROJECT IMPLEMENTATION

10. FINANCIAL AND ECONOMIC EVALUATION

TOTAL INVESTMENT OUTLAY

PROJECT FINANCING

PRODUCTION COST

COMMERCIAL PROFITABILITY

SOCIO-ECONOMIC EVALUATION

Project Background and History.

A. Project Background

1. New Project, expansion, modernization, etc.
2. Product and Product mix description
3. Plant capacity, the programme to attain it and location
4. Market or raw material orientation
5. Number working days, shifts and implementation schedule
6. Product quality, economic shelflife, technical particularities, special requirement for storage, transportation, usage
7. Product uses and applications
8. Project objective, what it will achieve (self sufficiency, job creation, advance technology). Economic, Industrial, financial and other policies supporting the project.

B. Sponsor/Proponent

1. Sponsor/Proponent current activity (products being manufactured quality, quantity) his financial means and role in the project.

C. Project History

1. History development of project (year of establishment, legal form, ownership structure) and its development.
2. Studies performed (title, author, date ordered party)
3. Decision taken from these studies.

D. The management organization and list of executive management with brief C.V. and organization chart.

E. Agreement and License

1. Technical know how, management agreement, licensing, patent .
2. Contract with engineers, architects, quantity surveyors, consultants, contractors, project technical partners or managers, sales take-out.
3. Government and/or business license requirements.

UNIDO TRAINING WORKSHOP SEMINAR  
IN INDUSTRIAL RESOURCE  
PREPARATION, EVALUATION AND FINANCING

Prepared by  
T. ORFALY

MATERIALS AND INPUTS

(April 16 - May 4, 1984)

IN  
HAVANA - CUBA

MATERIALS & INPUTS

- close relation between input requirement and production programme, location and technology and equipment.

Material and inputs classified into

1) Raw Material (unprocessed or processed) - Quality assessed mainly for agricultural production

- for project based on future agricultural production call for actual cultivation test

- Mineral should be based on proven reserves and lab analysis

Quality of material (case of high content of sulfate and chloride in aggregate would danger to prestress concrete.

2) Processed industrial materials and components.

- base metals, semi-processed and manufactured parts: define requirements, availability and costs,
- potential sources, alternative sources, and prices,

3) Auxiliary materials and factory supplies:

- chemicals, additives, packaging materials paints, factory supplies, as maintenance material.

4) Utilities: electricity, water, steam, compressed air, fuel, effluent disposal made after selection of technology plant capacity and location, Bottle-racks (electricity, water...)

- electricity = maximum power demand, the connected load, standby
- water = general estimate for production, auxiliary and general and quality of water Brakish (recycled)
- fuel = for cars, for diesel engine etc.

Input alternatives = different raw material that can be used should be studied

#### Qualitative properties of Material and inputs

Physical properties : size, dimension, form, density, porosity  
gaseous, liquid, solid, melting and boiling point.

Mechanical properties: formability, elasticity, hardness, fatigue resistance

Chemical properties: Form, composition, purity, flammability

Electrical and magnetic: magnetization, conductivity to elect.

#### Sources and quantities available

Viability of project are based on constant availability of M.I.

The location of M.I. where it is available is important as its transportation cost and Time and the available mean of transport (case of cement)

When M.I. are to be important the source of import identified and alternative sources lined up

uncertainty of constant supply should be mentioned.

#### Unit costs

- Past trend and future projection, elasticity.
- For import CIF + land transport + Taxes should be used.

#### Supply Programme

Production programme serve as a basis to calculate inputs  
additional storage cost should be added

UNIDO TRAINING WORKSHOP ON ENGINEERING  
IN INDUSTRIAL PROJECT  
PREPARATION, EVALUATION AND FINANCING

Prepared by  
T. O'REALY

LOCATION AND SITE  
(April 16 - May 4, 1984)

IN

HAVANA \* CUBA

## LOCATION AND SITE

### Public Policies

- subsidies to locate in underdeveloped area
- decentralization
- pollution

### Material/Market orientation

- Proximity to raw material and input availability
- Proximity of consumption centre
- Infrastructure facility availability
- based on above calculate transport, production and distribution cost at alternative location
- imported material project located close to port or terminals.
- agro-industry close to market or perishibles
- petrochemical not affected be it near resource or consumption on intermediation point (singapore).

### Location conditions:

Infrastructure: infrastructure availability vital to the operation

- if electricity not available and location cannot be changed special power station to be accounted for
- Rail, road, water, sea, air transport availability to be studied as per distance, congestion, fees, storage facilities, cranes, road width, bridges, section of road to be constructed to the factory rolling stock of rail (cement case)
- water transport, barges, other vessel (case of pre-fab. & pre cast on barges, container so - so, lash system)

- water availability and quality (recycling it or not and cost of the production, utility and human consumption (water well and purification and system cost),
- Telex, Telephone, Banking, Post Office, Schools etc.

Socio-economic environments:

- waste disposal (emission, noise, liquid, solid) To solve these problem
- labour availability: skilled, semi-skilled, cost, housing and Training.
- cost of construction might be a determinant
- fiscal and legal : income tax (T.F.Z.), excise duties, sales tax (Quebec, Alberta) incentive concessions, industrial park.
- climatic = climate temperature, humidity (textile), air condition, rainfall, flooding, dust fumes, earthquake.

Final choice of location

Starting point should be the raw material source and consumption centre followed by the analysis of all the above described element.

The best location where production cost lowest. For other project here it does not make any difference to locate where social welfare availability would be the determinant.

### Site Selection

Two or 3 different sites should be considered

evaluation of the characteristics of each:

- cost of land (or rent) industrial park
- local condition: infrastructure and socio economic environment
  - /availability and cost of electricity (extention line and power substation)
  - /Transport availability clos to rails, road etc.
  - /water availability from pipe, river, well(Pulp and Paper Industry)
  - /disposal of effluent (current and wind direction to urban area carefully studied)
  - /labour availability (housing availability)
  - /soil condition, ground water level

### Final Site Selection

Based on above however sometime according to project sponsors desire.

ENGINEERING WORKSHOP SEMINAR  
IN THE AREA OF  
DESIGN, EVALUATION AND FINANCING

Prepared by  
T. ORFELY

MAN POWER  
(April 15 - May 4, 1984)

IN

HAVANA - CUBA

## MANPOWER

- After determining plant production programme and establish technological process.
  - Prepare organizational layout
  - Skill requirement in each position
  - Availability of labour, local/foreign
  - Selection of labour
  - Prepare detailed structure (organizational chart)
  - Estimate annual labour cost at nominal feasible capacity divided into
    - /cost of production labour (variable)
    - /Cost of non-production labour (fixed)

### Staff

- Prepare organizational layout for staff
- Skills requirement and level of training
- Availability of staff local/foreign
- Estimate annual staff cost of local and foreign staff

### Manpower Requirement

- Manpower planning start at departmental level (workers: supervisor, skilled, semi-skilled, unskilled; staff: managerial, administrative, sales).
- Consideration given to
  - /supply and demand of manpower
  - /skills availability at national and regional level
  - /knowledge of labour legislation, recruitment procedures and discharge, wage level, fringe benefits and growth rate, number of shifts.
  - /number of annual working days (200 - 250 yearly).

### Preproduction period

Distinction between preproduction and operation

- Preproduction: To attend to the construction and installation of equipment (maintenance workers). Establishing required man/month. To be capitalized Foreign expert requirement should be mentioned on the basis of man/month or lump sum, this should be tied to local manpower training if possible.

### Operational bases

- Functions and skill level determined for total project
- Distinction between variable and fixed wage should be made and local and foreign manpower
- number of shift identified
- wages and salary + sick and training, leave + social security + fringe benefits, medical insurance and installation grants = total wage cost.

### Labour Norms

Productivity from country to country differs for inadequate skills and experience. Thus Training is required more under these conditions. It is essential that the locally expected productivity be used not the ones of other developed countries.

### Managerial staff

Managerial staff requirement in the feasibility study so that they be recruited well in time.

Success of the project mainly depend on the competence of the Team Managerial staff.

### Foreign Experts

Lack of technical and managerial skill to be complemented by extensive Training in foreign countries or locally as part of technology supply.

Employment of foreign expert to be minimized as it does not develop local skills and the period should be defined and limited and should be to training local counterpart.

### Training

Training should be programmed before start up of operation as  
in house training or,  
at outside institute or,  
at another country factory or supplier.

- Defined the training requirement for each category, location and arrangement.
- Training should be part of Technical assistance, agreement on Technology, licensing or joint venture.
- Training is not only required during the preproduction period but also during operational stage every number of month or years.

### Example of Calculation of surcharge on wages and salaries

- Official holidays	11 days
- Leave (according to labour law)	20
- Sickness ( " to statistics)	11
- Training and others	8
	<hr/>
	50 days/210 working days and excluding Thursday & Friday
	= 24%
+ Social security (employer part)	= 10%
+ " " on unproductive working days.	= 2.4%
	<hr/>
	36.4%
	<hr/>

PLANT ORGANIZATION AND OVERHEAD COSTS  
April 16- May 4, 1984

IN

HAVANA - CUBA

## PLANT ORGANIZATION AND OVERHEAD COSTS

- Plant divided into component (production, service and administrative cost center) is necessary.

### Plant Organization

Overhead cost should be properly appropriated to operation of the factory or the administration or the sales and distribution.  
examples

- Production cost center: where all productive of operation are undertaken (Marble case). Marble Block extraction, Transport, cutting, recutting, polishing, packing and crating.
- Service cost center:
  - Social services e.g. housing, health service, transport
  - production workshops
  - off-site transport not related to production
  - raw material and spares purchase
  - storage services (spares, crates, suppliers)
  - repair and maintenance
  - electricity (power station)
  - steam
  - water supply
  - laboratories
- Administration and finance cost center:
  - planning, budgeting, costing, statistics, personnel, training, accounting and finance.

### Overhead Cost

Factory overhead: related to the fabrication process.

- wages and salaries (not directly involved in production)

- auxiliary material
- office supplies
- utilities
- repair and maintenance

To be transferred to the annual production cost schedule as part of the factory cost

Administrative overhead: when amount are important otherwise to be included under factory overhead.

- wage and salaries
- office supplies
- utilities
- communication
- rents
- insurance
- taxes

To be transferred to annual administration cost schedule as part of the factory cost.

Depreciation: is dealt with separately and is presented in the annual production cost to obtain the total production cost.

THE TIME VALUE OF MONEY

- TIME VALUE OF MONEY = TIME PREFERENCE IN INVESTING
  - = THE COST OF OPPORTUNITY
  - = THE COST OF MONEY
  - = THE RENT OF MONEY

ABBREVIATION AND TERMINOLOGY

- C.F. = Cash flow التدفقات النقدية
- DCF = Discounted Cash Flow التدفقات النقدية المخفضة
- P.V. = Present Value القيمة الحالية
- N.P.V. = Net Present Value القيمة الحالية الصافية
- N.P.V.P. = Net Present Value Per القيمة الحالية الصافية لكل وحدة
- I.R.R. = Internal Rate of Return معدل العائد الداخلي
- P.P.T. = Pay-off Time (M)

DEFINITION

DEPRECIATION/AMORTIZATION:

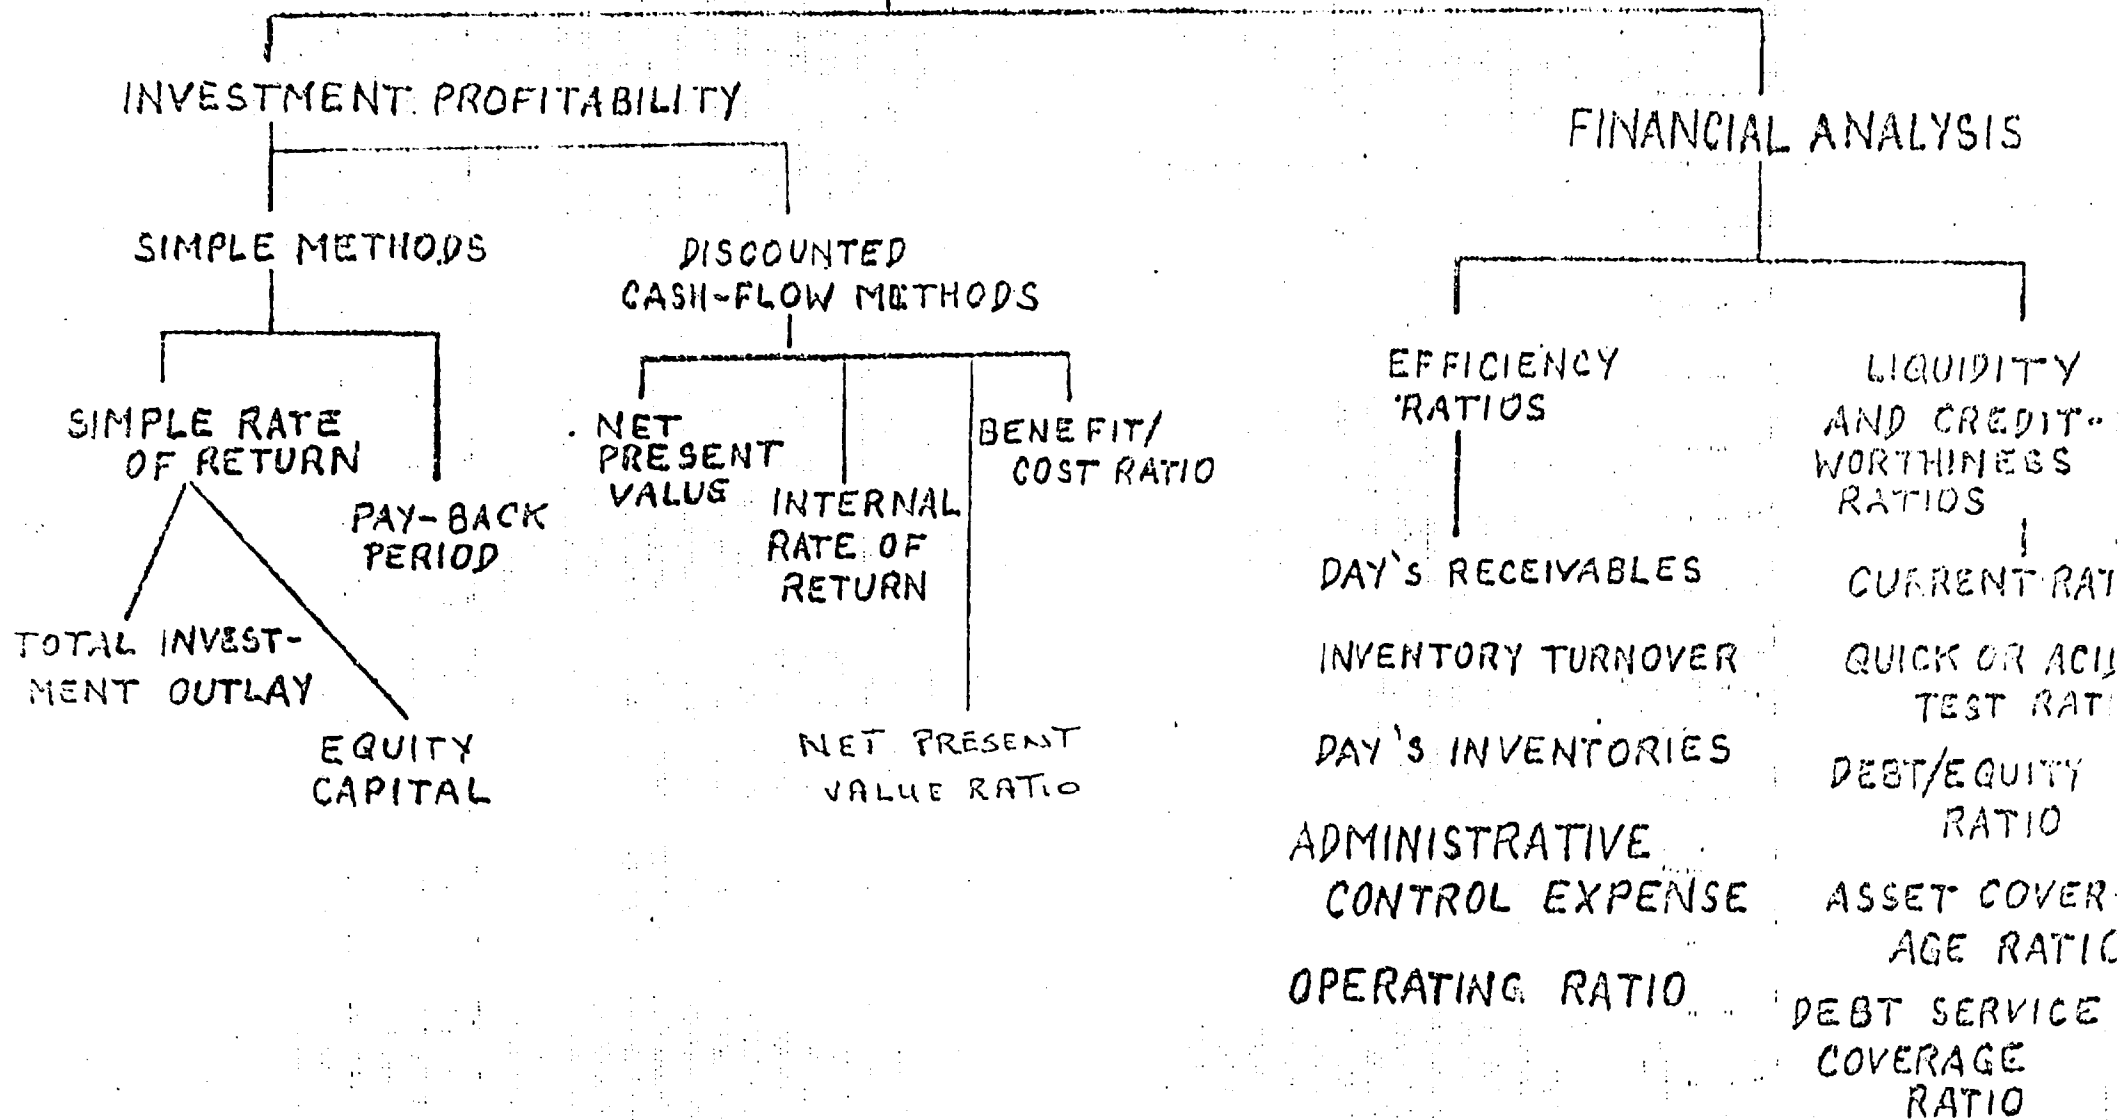

is a way of NON-CASH production  
asset (M).

الاستهلاك

مكسبة استثمارات غير نقدية

# COMMERCIAL PROFITABILITY ANALYSIS

## 1. INVESTMENT PROFITABILITY

### 1.1 DISCOUNTING METHOD

#### 1.1.1 NET PRESENT VALUE (N.P.V.)

The net present value (N.P.V.) of a project is defined as the value obtained by discounting, separately for each year, the difference of all cash outflows and inflows occurring throughout the life of a project at a fixed, pre-determined interest rate called discounting rate to the time when decision is taken to implement the project at year 0.

The discount rate or cut-off-rate, should be equal either to the actual rate of interest on long-term loan or to the interest rate paid by the borrower. This discount rate should reflect the opportunity cost of capital or the possible return on the same amount of capital invested elsewhere. The discount rate should be the minimum rate of return below which an investor considers that it does not pay for him to invest.

The N.P.V. obtained for the years of the life of the project are added to yield a total amount that could be written as follows:

$$N.P.V. = NP_0 + \frac{NP_1}{(1+i)^1} + \frac{NP_2}{(1+i)^2} + \dots + \frac{NP_n}{(1+i)^n}$$

where  $NP_t$  is the net cash flow on a project in year  $t$ ,  $i$  is the discount rate in year  $t$ , and  $n$  is the discount factor in year  $t$ .

If the N.P.V. is positive, the profitability of the investment is above the cut-off discount rate and the project is profitable. If the N.P.V. is zero, the project probably should not be undertaken. If the N.P.V. is negative, the profitability is below the cut-off rate and the project should not be undertaken.

The problems of the N.P.V. are the difficulty in selecting the appropriate or accurate discount rate (cost of capital) and that N.P.V. does not show a profitability rate. In addition, it does not account for the life of the invested capital.

#### 1.1.2 Net present value ratio (N.P.V.R)

In case of more than one opportunity project, it is advisable to

Now how much investment will be required to generate these positive NPV. The ratio of the NPV and the present value of the invested capital (PVI) required is called the net present value ratio (NPVR) and yields a discounted rate of return which is used to compare alternative projects. The formula is

$$NPVR = \frac{NPV}{PVI}$$

NPVR = Net Present Value Ratio

NPV = Net Present Value

PVI = Present Value of the Invested Capital

This method accounts for the size of the invested capital.

When only one project is being considered a positive choice should be made if the NPVR is greater than or equal to zero. When comparing alternatives, a more complex rule is used. The same discounting rate for all projects is used for the differences in the discounted period. It should be noted that as a rule for the payback period should be applied. The preference of money.

#### INTERNAL RATE OF RETURN (IRR)

The internal rate of return (IRR) is that rate of discount which will cause the present value of all cash inflows to equal the present value of all cash outflows and viewed as a zero value. It is the rate of return which will cause the net present value of the project to be zero. It is expressed as:

$$\sum_{t=1}^n \frac{F_t}{(1+r)^t} = 0$$

where  $F_t$  = net cash flow in period  $t$

$r$  = internal rate of return

When the IRR is greater than the cost of capital or the opportunity cost, the project should be accepted and if it is lower than the cost of capital the project is to be rejected.

### How to calculate the IRR.

#### a) Linear interpolation formula.

1. Prepare a cash-flow table.
2. Use first estimate of IRR and calculate NPV.
3. If NPV is positive, apply higher value of IRR and calculate new NPV.
4. If NPV is negative, apply lower value of IRR and calculate new NPV.
5. Repeat procedure, until NPV changes sign.
6. Apply formula

$$IRR = r_1 + \frac{PV_1 (r_2 - r_1)}{PV_1 - PV_2}$$

where  $PV_1$  is the NPV (positive) at the low discount rate of  $r_1$ , and  $PV_2$  is the NPV (negative) at the high discount rate  $r_2$ .

The shortcoming of I.R.R. is the assumption that funds returned early in the life of a project can be reinvested at whatever I.R.R. happens to be. At high I.R.R., this assumption is obviously not valid. Furthermore, the I.R.R. method may provide multiple solutions.

#### Benefit/Cost Ratio (B/C ratio)

The benefit/cost Ratio of discounted cash-flow is the index obtained by forming a ratio of the present values of cash inflows to the present values of cash outflow.

$$B/C = \frac{\sum_{t=0}^n (CI)_t (1+i)^{-t}}{\sum_{t=0}^n (CO)_t (1+i)^{-t}}$$

where  $CI_t$  is the discounted cash inflow and  $CO_t$  is the discounted cash outflow.

It is to be noted that other alternative formulation exists.

# NUMERICAL EXAMPLE FOR NPV

YEAR $i$	REVENUES	EXPENDITURES
0	-	2 000
1	-	8 000
2	5 000	4 000
3	10 000	6 000
4	10 000	6 000
5	10 000	6 000
6	10 000	6 000
NPV	-	-

# CALCULATION

NCF <sub>i</sub>	a <sub>i</sub> at r = 10%	PRESENT VALUE
- 2000	1.000	- 2000
- 8000	0.909	- 7272
1000	0.826	826
4000	0.751	3004
4000	0.683	2732
4000	0.621	2484
4000	0.564	2256
-	-	2030

B) SIMPLE METHODS (NOT DISCOUNTED)

1. PROFITABILITY RATIOS

1. MARGINS

1.1 Gross Profit Margin: is defined as:

$$\frac{\text{Sales less Cost of goods sold (factory cost)}}{\text{sales}}$$

1.2 GROSS PROFIT/SALES: is defined as taxable profit/sales and is to measure the profitability of the project before taxes.

1.3 NET/PROFIT/SALES: is to measure the profit margin of the project after taxes

1.4 RATE OF RETURN: (should be higher than interest rate in capital market)

1.4.1 Net Profit/Paid up Capital: is to measure the profitability of the project vis a vis its equity capital

$$R_a = \frac{NP}{C} \times 100$$

R<sub>a</sub> = rate of return on paid up capital

NP = Net Profit

C = Paid up Capital

1.4.2 Net Profit/Shareholders Equity or Net Worth: is to measure the profitability of the project vis a vis the total shareholders equity.

R<sub>n</sub> = rate of return on net worth

NP = net profit

Q = Net worth

1.4.3 Net Profit/Total Investment Cost (including power): is to measure the project profitability vis a vis the total investment cost (fixed assets + pre-production cost + working capital)

R = Total investment

I = Interest charges

R = rate of return on total investment cost

NP = Net profit after depreciation, interest charges and tax.

SPECIAL INVESTMENT COST: is defined as (Total investment cost - working capital)/Production output. It is to measure how much each unit of production output necessitate in fixed investment cost. In other words the efficiency of the investment cost put into this technology example

(100 - 10) million / 1000000 ton = 0.09 million / ton

1.6 SPECIFIC PRODUCTION COST: Is defined as gross profit before tax or taxable profit/production output. It is to measure the efficiency of the production process. Example

$$\frac{\$ 11.5 \text{ million}}{15000 \text{ tons}} = \$ 766 \text{ production cost per ton of cement.}$$

1.7 Turnover: Relates the level of assets with output. It is defined as sales/total assets. Turnover of a food project is different from Turnover of a Jewellery project.

## 2. TIME PICK ANALYSIS

2.1 PAY-BACK PERIOD: The pay-back period is defined as the period required to recuperate the original investment outlay through profits earned by the project. "Profit" is defined as net profit after tax, added financial cost and depreciation. Assumption usually start with the construction period during which the initial investments will be made.

A project proposal may be accepted if the pay-back period is smaller than or equal to an acceptable time period.

The shortcoming of pay-back method is that it gives no consideration to the time of the cash flow and hence, the time value of money, within the pay-back period or even to any cash flows that might generate after the pay-back period. Furthermore, it does not ensure the profitability of the project.

# INVESTMENT PROFITABILITY SIMPLE METHODS

## SIMPLE RATE OF RETURN

$$R = \frac{\text{NET PROFIT} + \text{INTEREST}}{\text{TOTAL INVESTMENT COSTS}}$$

$$R_e = \frac{\text{NET PROFIT}}{\text{EQUITY}}$$

YEAR 6

$$\bullet \frac{(2544 + 176) \times 100}{10300} = 25\%$$

$$= \frac{25400 \times 100}{5800} = 43.8\%$$

YEAR 8

$$R = \frac{(1360 + 0) \times 100}{10300} = 13.2\%$$

$$R = \frac{1360 \times 100}{5800} = 23.4\%$$

# INVESTMENT PROFITABILITY

## SIMPLE METHODS

### PAY-BACK PERIOD

PAY-BACK PERIOD =  $\frac{\text{PAY-OUT}}{\text{Profit}}$  = The time it takes to recover the investment costs through profits\* earned.

\* Profit = net profit after tax + financial cost + depreciation.

	Amount paid back (Profit)	Balance end year
Year 1 construction	—	10300
- " - 2 construction	—	10300
- " - 3	870	9430
- " - 4	2030	7400
- " - 5	2330	5070
- " - 6	3500	1570
- " - 7	3500	-

PAY-BACK PERIOD = 6.5 years

CONSTRUCTION PERIOD } PAY BACK = 4.5 years  
 NOT INCLUDED

## II - FINANCIAL ANALYSIS

(Financial ratio)

### 1. LIQUIDITY RATIOS

1.1 CURRENT RATIO: is defined as current asset/current liabilities. It measure the ability of the project to meet its current liabilities due within one year from the current assets. Rough measure (inventory not so liquid).

1.2 QUICK (ACID TEST) RATIO: is defined as

$$\frac{\text{current assets} - \text{inventories}}{\text{current liabilities}}$$

It is to measure the highly liquid asset to meet current liabilities.

1.3 RECEIVABLES TURN-OVER AVERAGE (COLLECTION PERIOD): It measures the average time necessary to collect the receivables. It is defined as: Annual credit sales/average receivable outstanding

OR a more useful approach

$$\frac{\text{Average (or year end) level of receivables} \times 365}{\text{Annual credit sales (or annual sales)}} = \text{days}$$

1.4 INVENTORY TURNOVER: It measures how many time a year inventory is turned-over. It is defined as: Cost of goods sold or factory cost/average inventory = ? times. It reveals a slow moving inventory or even when inventory is obsolete, or it necessitate to reduce price to liquidate inventory. It might suggest that inventory is over-valued.

Another approach is

1.5 AVERAGE DAY'S INVENTORY: It measures the time necessary for the inventory to be liquidated. It is defined as

$$\frac{\text{Average inventory} \times 365}{\text{cost of goods sold}} = \text{days}$$

1.6 BASIC DEFENSIVE INTERVAL: It measures the ability of the project to meet its most pressing obligations. It is

defined as cash + marketable securities + receivables / daily operating expenditures. Daily operating expenditures are determined by summing all cash operating expenses of the year (cost of goods sold + selling, general and administrative expenses) and dividing by 365.

## 2. FINANCIAL LEVERAGE

2.1 LONG TERM DEBT TO EQUITY RATIO: It measures the financial risk that a project faces and compares borrowed long term loan and owned funds. It is defined as long term debts (of all kind) to total equity.

2.2 TOTAL DEBT TO EQUITY RATIO: It measures the financial risk that a project faces and compares total borrowed long and short term funds to owned funds. It is defined as Total debt to total equity.

2.3 SHAREHOLDERS EQUITY/TOTAL LIABILITIES + NET WORTH: It measures the financial risk that a project faces and assess the portion of the shareholders' equity to the total liabilities + net worth.

## 3. COVERAGE RATIO

3.1 INTEREST COVERAGE: It measures how many times interest requirement on long-term debt is being met. It is defined as:

$$\frac{\text{Net income plus depreciation/taxes and interest on long term debt}}{\text{Long-term debt interest requirement.}}$$

3.2 LONG-TERM DEBT SERVICES COVERAGE: It measures how many times interest plus long term debt repayment is being met. It is defined as:

$$\frac{\text{Net cash flow + debt service for interest + loan repayment + tax + dividend}}{\text{Long-term debt interest and debt repayment requirement.}}$$

## 4. EQUITY RATIOS

4.1 EARNINGS PER SHARE: It measure the earning per each share of the project.

It is defined as:

$$\frac{\text{Net income available to common shareholder}}{\text{number of common share issued}}$$

- 4.2 DIVIDENDS PER SHARE: It is the payout to each share. It is defined as:  $\frac{\text{Common Dividends paid}}{\text{number of common shares issued}}$ .
- 4.3 PAYOUT: It is the ratio of the paid dividend or proposed to be paid dividend to the total earning. It is defined as:  $\frac{\text{Total Dividends}}{\text{total earning}}$
- 4.4 PRICE-EARNINGS RATIO (P/E): It is the ratio of the market price of a share to its earning. It is defined as:  $\frac{\text{Market price of a share}}{\text{its earning}}$ .
- 5.5 YIELD ON COMMON SHARE: It is the ratio of the common dividend to the market price of a share. It is defined as:  $\frac{\text{Dividends per share}}{\text{market price per share}}$ .
- 5.6 BOOK VALUE PER SHARE: It is the value of each share as per the accounting book of the firm. It is defined as:  $\frac{\text{Total stockholders' equity}}{\text{number of common shares issued}}$ .

UNIDO TRAINING WORKSHOP SEMINAR  
IN INDUSTRIAL PROJECT  
PREPARATION, EVALUATION AND FINANCING

Prepared by  
T. ORFALY

FINANCIAL EVALUATION UNDER UNCERTAINTY  
(April 16 - May 4, 1984)

IN

HAVANA - CSBA

## FINANCIAL EVALUATION UNDER UNCERTAINTY

Forecasts of demand, production and sales may not be exact due to uncertainty about the future. The most common reasons for uncertainty are inflation, changes in technology, false estimation of the rated capacity. When dealing with an investment under conditions of uncertainty 3 variables should be examined:

- Sales Revenues
- Production cost, and
- Investment cost

Uncertainty analysis can be analysed by 3 methods:

### 1. THE BREAK-EVEN POINT (B.E.P)

Break-even analysis determines the break-even point at which sales revenues equal production cost. It can also be defined in terms of number of physical units to be produced, or the level of capacity utilization at which sales revenues and production cost match each other.

$$\text{Sales Value} = Y = P X$$

$$\text{Production cost} = Y = VX + F$$

$$PX = VX + F$$

Thus:  $X = \frac{F}{p - v}$  Physical units to be produced and sold

$$\text{Example: } \text{BEP} = \frac{3280}{6.25 - 3.25} = 1093 \text{ units}$$

High BEP render a firm vulnerable to changes in production level  
Expressed in terms of Sales Revenues it becomes

$$X = PX \frac{F}{p - v}$$

$$\text{Example: } \text{BEP} = 6.25 \times \frac{3280}{6.25 - 3.25} = \$ 6,833$$

Another form of BEP is the capacity utilization

$$\text{BEP} = \frac{F}{r - v}$$

where F = fixed cost

V = Variable cost and

r = is the sales revenue at full capacity.

Example =

$$\text{BEP} = \frac{3280}{12,500 - 6,500} = 55\% \text{ capacity utilization}$$

Several BEP can be calculated based on different alternative investment and installed capacities.

## 2. Sensitivity Analysis

Sensitivity analysis is introduced to sensitise the project outcome as a result of a possible change in:

- The per unit sales
- The sales volume
- The per unit cost of production - (change in: labour cost, raw material, energy)

an optimistic and pessimistic ranges the investors can have a better view of the possible future outcome. Or the study could be built on the most pessimistic probability.

Thus = assuming a reduction in the sales price in the previous example from 6.25 to 5.75 x (2 million units)

$$\text{BEP} = \frac{\text{Fixed Production cost}}{\text{Sales Revenue} - \text{variable production cost}}$$

$$\text{BEP} = \frac{3280}{11,500 - 6,500} = 66\%$$

applying the previous formula it is possible to find out the selling prices at which the project will break-even.

$$2,000 \times p = (\$ 3.25 \times 2,000) + 3280$$

$$\therefore p = \$ 4.9$$

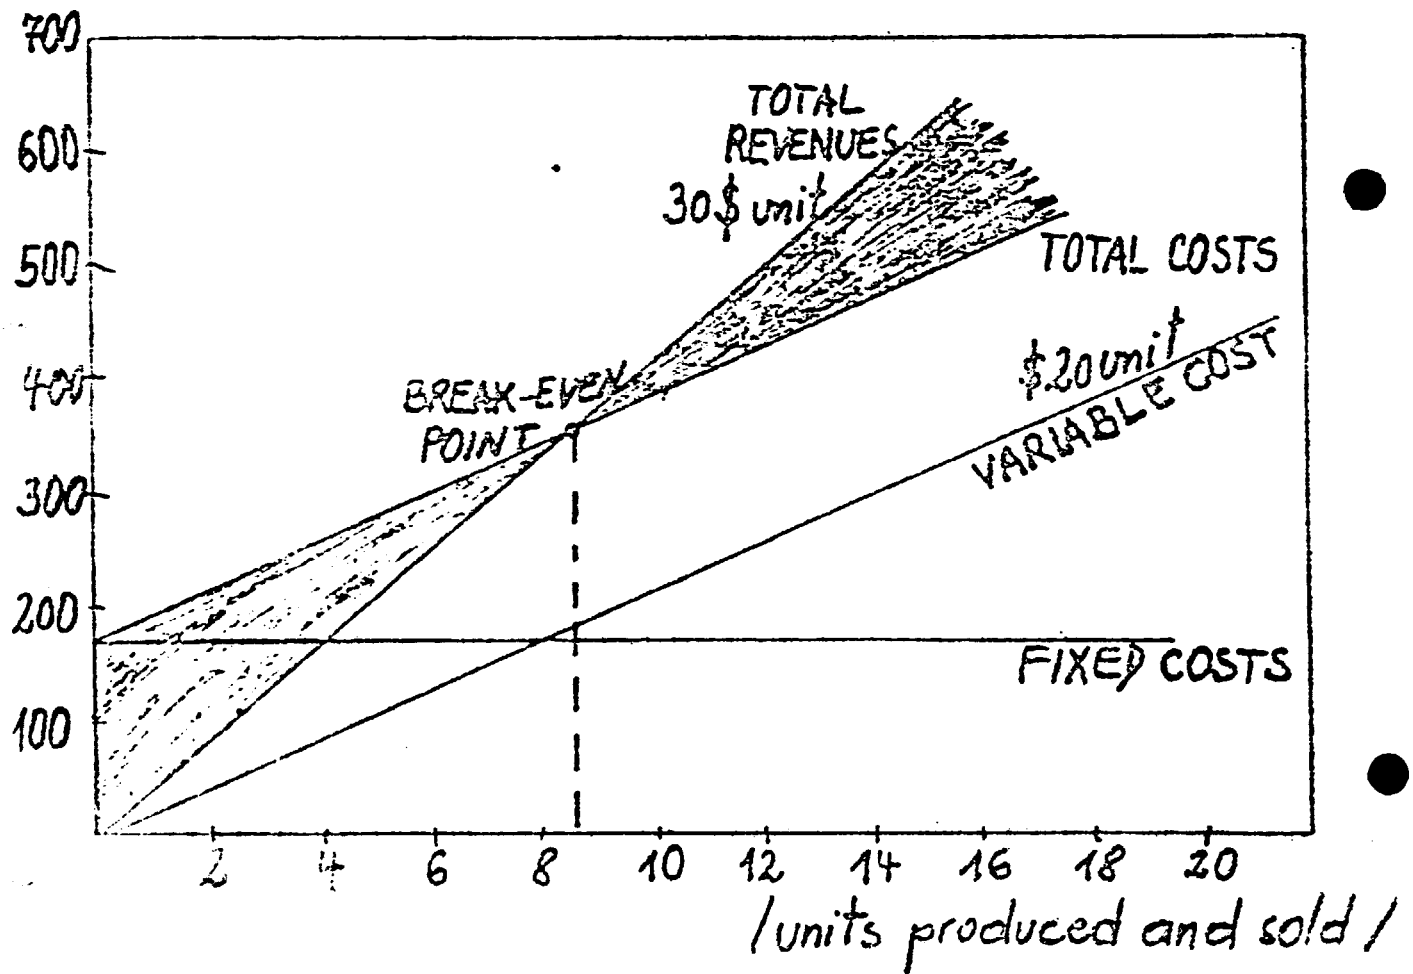

$$\text{Thus the safety margin is } \frac{6.25 - 4.9}{6.25} \times 100 = 21.8\%$$

which can be used for price reduction during the initial period of market penetration.

# BREAK-EVEN ANALYSIS

DETERMINES THE BREAK-EVEN POINT (BEP) - the point at which sales revenues equal production costs.

SALES

$$Y = PX$$

PRODUCTION COSTS

$$Y = VX + F$$

$$PX = VX + F$$

$$X = \frac{F}{P - V} = \text{physical units produced and sold}$$

The same exercise could be repeated to sensitise change in the variable cost or fixed production cost in order to examine the range of possible outcome.

### 3. Probability analysis and risk assessment

It is carried out with the objective of attaining higher accuracy. It tries to determine the probability of occurrence for each value of the variable which can have several values. Thus the number of computation are considerably increased and would usually require computer simulation programme.

Example:

<u>Outcome</u>	<u>Probability</u>
\$ 80,000	.3
50,000	.5
30,000	.2

The mode value of the outcome would be \$ 50,000

The median value of the outcome would also be \$ 50,000

The mean value of the outcome distribution \$ 55,000.

Thus the D.C.F. would be allocated to the probability occurrence and the results would be following the whole procedure previously described to attain the IRR & NPV.

There is an inverse relationship between the investment value and the risk (probability occurrence) associated with the payment stream generated by that asset. From the measure of central tendency we can develop a measure of risk. The most frequently employed measure of dispersion around the central tendency of a distribution is the standard of Deviation ( $\sigma$ ) expressed as:

$$\sigma = \sqrt{\sum_{t=1}^n (O_t - u)^2 p_t}$$

where

$\sigma$  = Standard of deviation

$O_t$  = The expected outcome

$u$  = The mean

$pt$  = The probability occurrence

Applying the previous example we get

$O_t - u$	$(O_t - u)^2$	$pt$
\$ 80,000 - \$ 55,000 = \$ 25,000	$(25,000)^2 = 625,000,000$	$(.3) = \$187,500,000$
50,000 - 55,000 = - 5,000	$(-5,000)^2 = 25,000,000$	$(.5) = 12,500,000$
30,000 - 55,000 = - 25,000	$(-25,000)^2 = 625,000,000$	$(.2) = 125,000,000$
		\$ 325,000,000

$$\sigma = \sqrt{\$ 325,000,000} = \$ 18,028$$

The larger the standard deviation, the greater the risk associated with the distribution.

Another way to associate risk versus return is better explained on a graphical chart where the investor could plot his scale of preference of return versus risk.

ANNEX IV

H A N D O U T S

presented by Mr.O. Heinone

UNION SUMMARY 1914-24-19/20 MARKET STUDY

1. Sequence for analyzing the marketing aspects of the project feasibility.
2. Description of market diagnosis/prognosis.
3. Check-list of data required.
4. Data collection and processing.

Figure 1. MARKET AND PLANT CAPACITY ANALYSIS FOR PROJECT'S FEASIBILITY STUDY; A SEQUENCE:

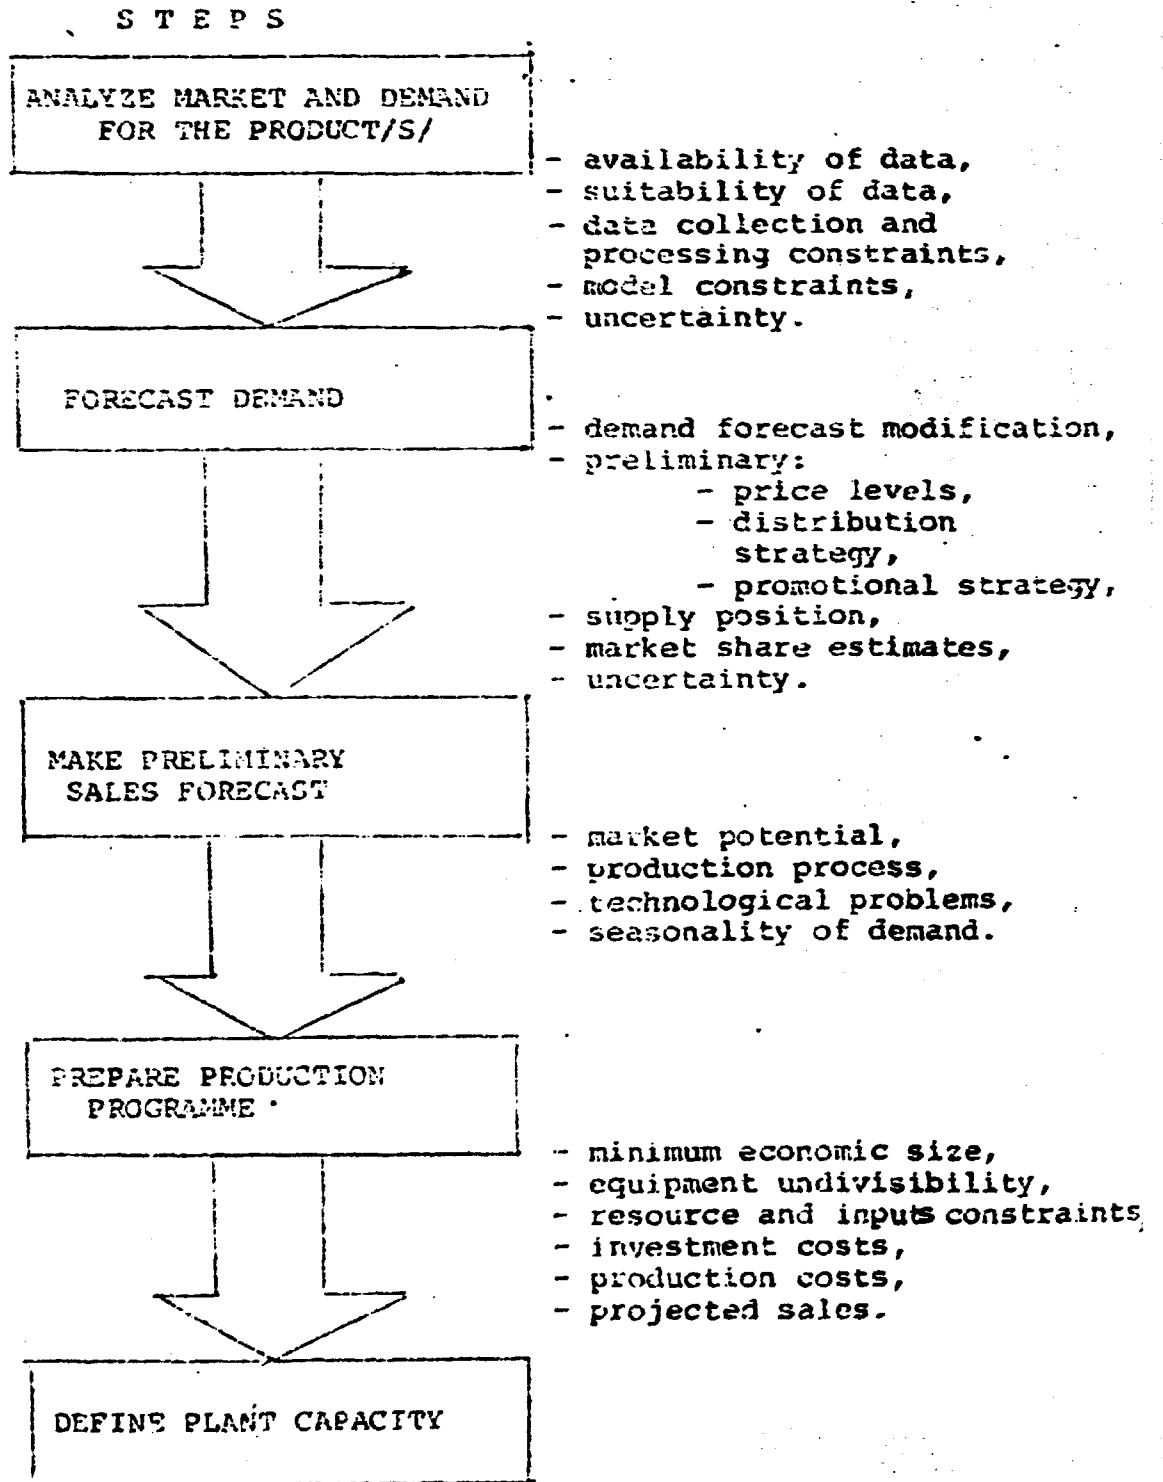

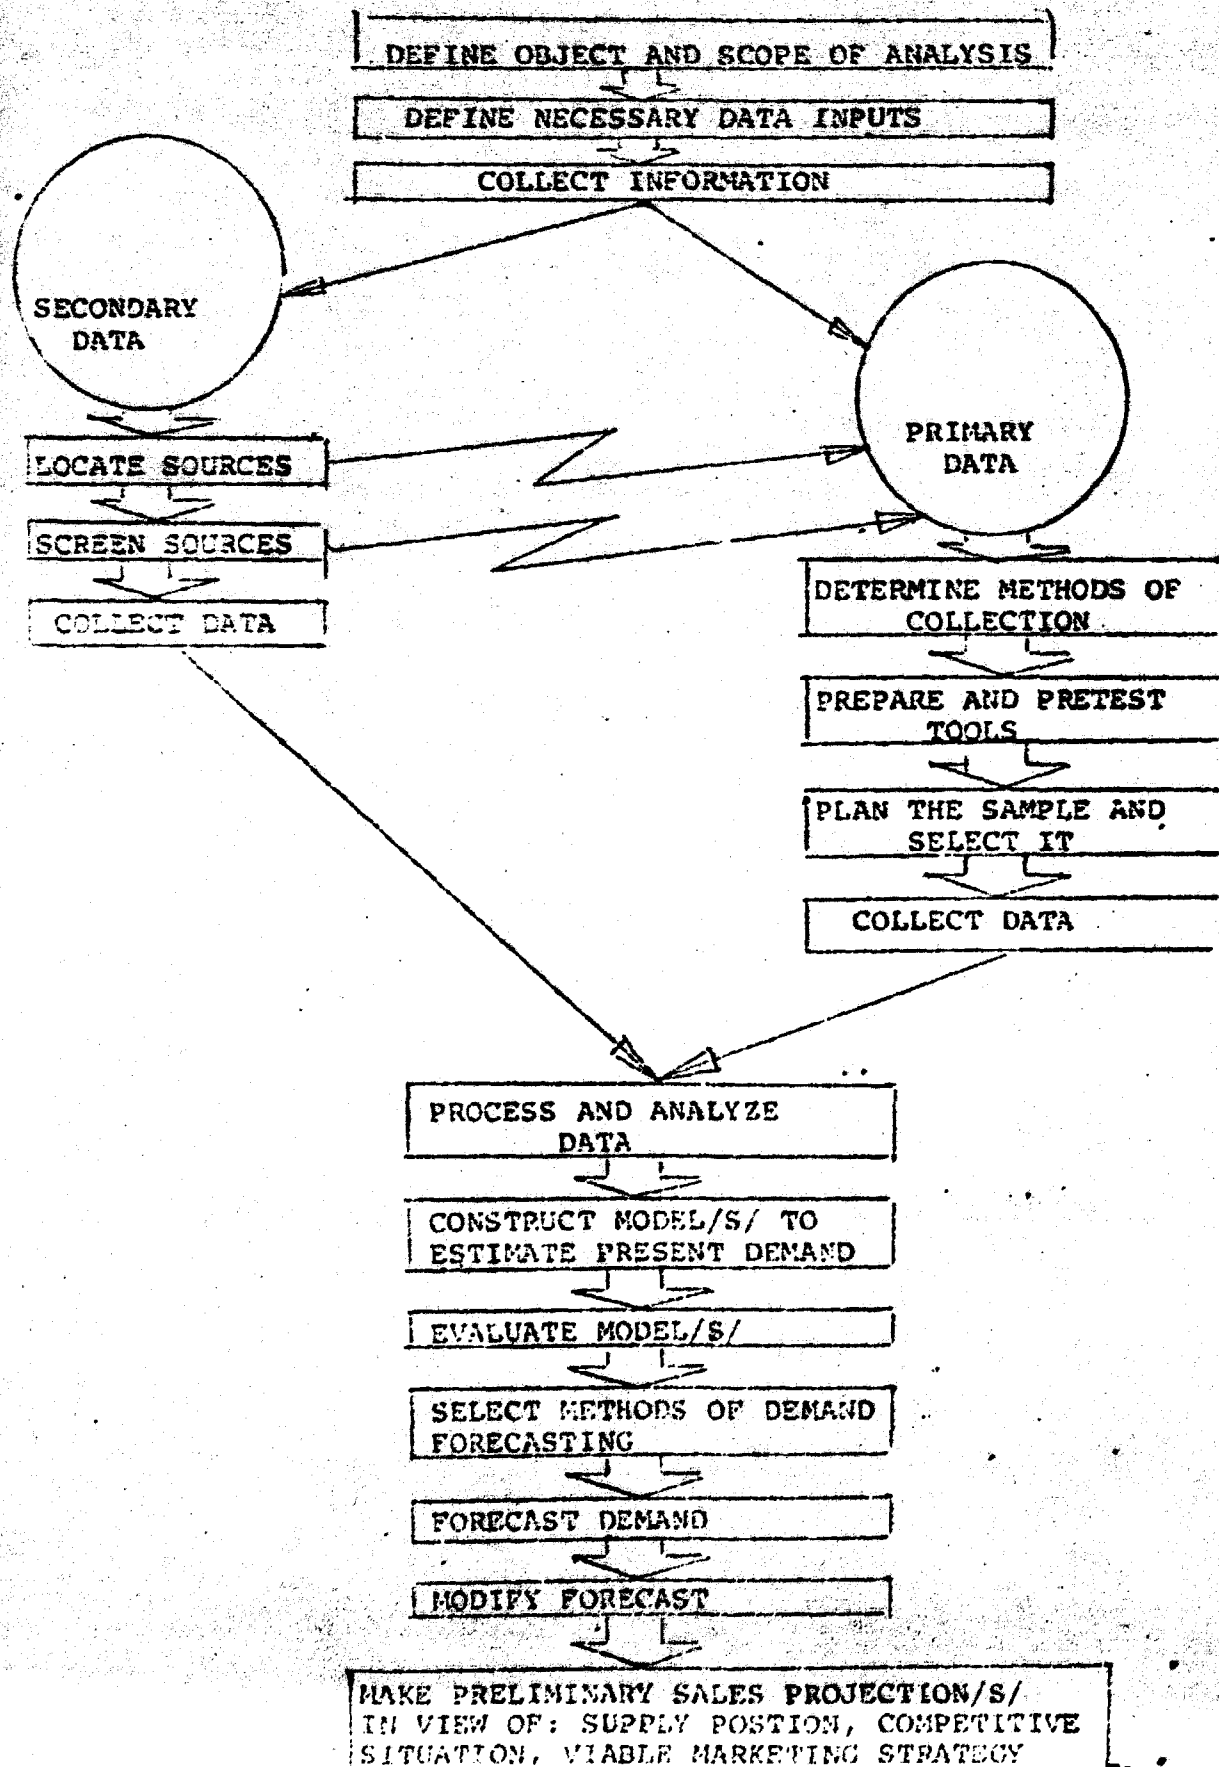

Figure II presents the standard procedure for demand and market analysis and forecasting. The outline of this procedure forms the backbone of discussion following in sections 2-10. A word of caution is perhaps necessary here. The practice of feasibility study preparation is largely an iterative procedure and therefore involves a number of back-and-forth steps. For example: the final sales projection cannot be made without a decision on specific price level, and this in turn cannot be made prior to analysis of production costs and break-even analysis, which will be conducted at the later stages. One should therefore deal with alternatives and never consider a particular stage as a closed compartment, to which there is no return once the next stage has been started.

To avoid misunderstandings in following the text simple definitions of terms most likely to appear confusing are presented below. These definition will be consequently followed throughout the text:

1. Demand: the quantity of goods that buyers are ready to purchase at a specific price in a particular market at a given point of time.
2. Market: an arena for potential exchanges.  
Despite the common use of both these terms interchangeably. "market" will have broader meaning than "demand", encompassing all the complex factors affecting the process of exchange.
3. Sales: the quantity of product that is actually purchased at a specific price and under specific marketing strategy in a particular market at a given point in time. Thus the industry sales will practically equal effective demand in the absence of supply shortages but project's sales may be substantially

Figure II. PROCEDURE FOR DEMAND AND MARKET ANALYSIS AND FORECASTING

smaller than the demand in the given market, depending on the project's capacity, marketing strategy and position vis a vis competitors.

4. Marketing-mix: set of controllable market variables crucial to any marketing strategy i.e.: product, price, distribution, promotion.
5. Promotion-mix: set of tools in the marketing-mix whose major role is persuasive communication i.e. advertising, personal selling, publicity, sales promotion.
6. Selling: one part of promotion and promotion is one part of the total marketing programme.
7. Distribution: retailing and wholesaling structure - the channels used to get the product to the market.
8. Physical distribution: materials-flow activities such as transpo. ation, warehousing and inventory control.

A check-list of data inputs for demand and market analysis: x/

(1) General economic indicators:

- area and climate,
- population (size and composition),
- resources,
- gross domestic product (size, dynamics, basic structure),
- industrial production (total and by sectors),
- geographic location of basic industries,
- ownership structure,
- exports (size, dynamics, structure),
- imports (size, dynamics, structure),
- balance of trade and balance of payments.

This should cover only information relevant to the specific product(s) under consideration (e.g. aggregate variables significant to the demand determining factors). General economic indicators should only present basic macro-economic framework within which the specific market functions.

(2) Data on product:

- product features: technical data on product, quality, sizes, colour, package, brand, label, perishability, bulkiness, etc.
  - product classification (see II, p. 14)
-

- product uses (single or multiple-use products)
- complementary and substitute products' description.

This data should supply information not only on the envisaged project's product(s) but also on market tastes, requirements and preferences. Combined with information on demand patterns (3) it should provide basis for modification of the original product idea in line with the specific market/sub-market detailed requirements that the project is designed to satisfy.

(3) Demand data:

- market size:
  - apparent consumption,
  - effective demand,
  - market saturation,
  - market potential,
- market segments:  
(see Section II : variables for market segmentation)
- determinants of demand:
- consumer markets:
  - general economic conditions,
  - demographic factors,
  - income (level, dynamics, distribution),
  - income elasticity of demand,
  - product price,
  - price elasticity of demand,
  - product obsolescence and fashion,
  - prices and availability of substitutes,
  - prices and availability of complementary goods,
  - cross-elasticity of demand,
  - behavioural patterns,
  - credit,
  - government policies.

- Industrial goods:

- general economic situation,
- expected profit and market position,
- price of the product
- price elasticity of demand,
- prices of substitutes,
- technological progress,
- number and types of industrial users,
- buying power of industrial users,
- credit,
- government policies.

- composition of demand:

- new v.s. replacement demand.

(4) supply data:

- local production:

- size, dynamics, structure,
- geographic distribution,
- concentration level,
- capacity utilization,
- availability and prices of inputs,
- investments, costs, profits,

- imports:

- size, dynamics, importers characteristics,
- quality,
- price,

- exports:

- size, dynamics, geographical structure.

For more detailed discussion of reasons for collecting the above information see apparent consumption concept (p.19).

(5) Marketing environment:

- product:

- particular segments' preferences as to the desirable product features,

- price:
  - price level and dynamics,
  - pricing policies and practices in the market,
  - standard markups,
  - customary discounts and allowances,
  - price competition,
  - legislation on pricing.
  
- distribution:
  - channels:
    - forms of ownership,
    - number and type of intermediaries,
    - marketing tasks that particular intermediaries can carry,
    - intermediaries' strengths and weaknesses,
  
  - physical distribution:
    - existing network's coverage and transportation routes,
    - types of carriers available,
    - costs of alternative routes and carriers,
    - warehousing system and costs.
  
- promotion:
  - existing promotional media,
  - most popular forms of promotion,
  - particular segments' susceptibility to different forms of promotion,
  - agencies,
  - costs.

This data is of particular importance to any marketing strategy developed for the product in question, however broad the strategy may be at this stage of the feasibility study. For more detailed discussion see VIII.

(6) Competition:

- types and intensity of competition,
- competitors' market shares,

- characteristics of major competitors,
- major competitors' (both: local and foreign) marketing strategies:
  - product features,
  - prices charged,
  - distribution channel arrangements,
  - transportation routes used,
  - promotional strategies,
- substitutes:
  - quality characteristic,
  - sales data,
  - availability (regional breakdown)
  - market responses (segment breakdown)
  - prices and other elements of marketing strategy.

Within the existing market institutions, pattern and restrictions the choice of the marketing strategy will, unless the market is fully protected, depend to a significant degree on the likely actions and reactions of the competitors. This type of information is particularly difficult to obtain and therefore the researcher will have to settle for much less comprehensive and consistent data than in the other aspects of the analysis.

(7) Government policies and legislation (not covered elsewhere) i.e.:

- investment incentives, credit facilities, tax holidays, market protection, subsidies,
- consumer credit, manipulating propensity to save, price control, taxes,
- tariffs and non-tariff barriers, quotas, customs duties,

- direct or indirect subsidies, foreign currency allocation, priorities for efficient exporters.

Data collected here should cover all aspects of government policy and legal considerations which the future project will have to reckon with. These are the constraints within which the project will have to operate and reasonable assumptions as to the future tendencies of the above constraints will have to be made.

The above checklist is applicable for a comprehensive export market analysis, as well as for the local one. Data on foreign market, collected along the presented enumeration should be supplemented by the following "export information" stemming from the specific character of foreign transaction.

(8) Terms and conditions of exporting:

- characteristics of specific intermediaries (exporter, importer),
- general description of types available,
- margins,
- effectiveness,
- reputation,
- contacts in export market,
- marketing tasks they are able and prepared to carry,
- transport and insurance:
  - traditional transportation means,
  - costs of freight and insurance,

- timing of delivery,
- delivery terms /c.i.f., c.a.f., f.o.b., f.o.r., f.o.t., etc./
- market accessibility:
  - tariffs and fees,
  - non-tariff barriers:
    - quality standards,
    - health and medical requirements,
    - package standards,
    - import quotas,
    - customs regulations,
    - political and administrative barriers,
  - trading habits,
  - ← terms and conditions of payments.

Whenever possible, apart from past and present information, available future plans, projections and perspectives should also be collected. The reliable sources in this respect are:

- national and sectoral development plans and programmes,
- macro-economic forecasts by reliable institutions,
- projects under construction.

#### IV. DATA COLLECTION AND PROCESSING

After having defined and described in detail the necessary data inputs the next step in the analysis is to organize for data collection process. Secondary data sources should be searched for and scrutinized first, since - compared with primary data - this category has the advantage of being:

- cheaper,
- less time consuming,
- easily available.

Secondary data, i.e. information that has been collected and compiled by some person or agency for purposes other than the solution of the problem at hand, can be broken down into:

- internal secondary information - the only source of which is the company/project for which the research is conducted, i.e.:

- financial statements,
- sales records,
- file of consumers' orders,
- sales compensation records,
- sales expense records,
- salesmen reports,
- others: price lists, customer correspondence, etc.

- external secondary information, the sources of which are:

- censuses and official government statistics,
- international statistics,
- official publications produced by United Nations agencies, OECD, GATT, EEC and other organizations,
- reports published by international and regional organizations,
- reports published by banks and other local organizations,

- encyclopaedias and other publications,
- customs regulations and tariffs,
- professional papers and journals,

other sources: trade associations, publishers, universities, government and private agencies, bibliographies, indexes etc.

At this stage of feasibility study there is precious little, if at all, internal data generated, unless the project under study is the extension of the one already existing and operating in the market. The bulk of information comes therefore from external secondary sources.

Such data is seldom complete for the purpose of a market study but constitutes an effective starting point. It is common, in many developing countries, for data to be available on general economic indicators but be inadequate or not readily available on existing production figures. In some developing countries such information is considered confidential as far as production in particular industrial enterprises is concerned. Import data are, of course, available from governmental agencies, but are not always accessible. In many cases, a number of items are lumped together; disaggregation is difficult, and figures cannot be identified for detailed product classifications and sub-classifications. Data on inventories are difficult to obtain, except for certain products in respect of which there are official publications.

Despite its obvious advantages, one should not therefore be uncritical in using secondary data for research purposes. Available information should be carefully scrutinized with respect to:

- the character of collector and/or sponsoring organization,
- the objectives of the original study,

- the methods employed in collecting and processing of data,
- classifications and definitions used,
- data aggregation,
- timeliness.

In the process, some of the secondary data sources will be screened out.

The need for primary data i.e. information collected for the first time to the researcher's knowledge, can be defined, after specifying the necessary data inputs for analysis, in order to cover the problem areas for which secondary data is known to be unavailable, incomplete or unsuitable or to supplement secondary information. The above screening process may, however, result in increasing the originally required primary data inputs as a consequence of rejecting some secondary sources previously considered to be reliable. This process is indicated in Figure II by cross-arrows.

The overall primary data requirements cannot therefore be assessed before screening of secondary data sources is completed.

There are three types of primary data:

- facts - those things that have objective existence,
- opinions - beliefs, attitudes, evaluations, estimates, preferences,
- motives - why people do what they do.

All these types should be sought after, as explained in Section III.

Primary data collection methods can be classified into:

- survey - data obtained in response to questions,
- observation - what is taking place is seen and recorded,

- experimentation - active character of the situation creation /market test/.

Market experiments /tests/ are not viable at this stage of feasibility study as they involve effective experimentation with product versions, packaging, advertising, prices etc. in the selected test areas /test markets/.

Observation in the forms of audits or watching people's behaviour by trained observers may be useful; although it should, as a rule, be supported by questionnaire to discover motives of observed behaviour. Another form of observation, involving hidden cameras, counting meters etc., is practically not applicable in the developing countries due to unavailability of recording devices.

Survey appears by far the most widely used method of primary data collection in the developing countries. Market surveys are to a great extent based on questionnaires as methods of obtaining specific information about a defined problem.

Questionnaires may be administered by:

- personal interview,
- mail,
- telephone.

The forms of a questionnaire will vary from a set of formal questions designed to obtain limited, precoded answers that can be easily processed by the machine /as in the case of a structured interview/ to a scanty "interviewing guide", outlining only the type of information being sought by the interviewer /non-structured interview/. In the latter, extreme case the wording of questions, as well as their sequence, is left to the interviewer's discretion and depends on the course of development of an interview as well as the personality and reactions of the respondent.

UNIDO SEMINAR, HAVANA

1964-4-24

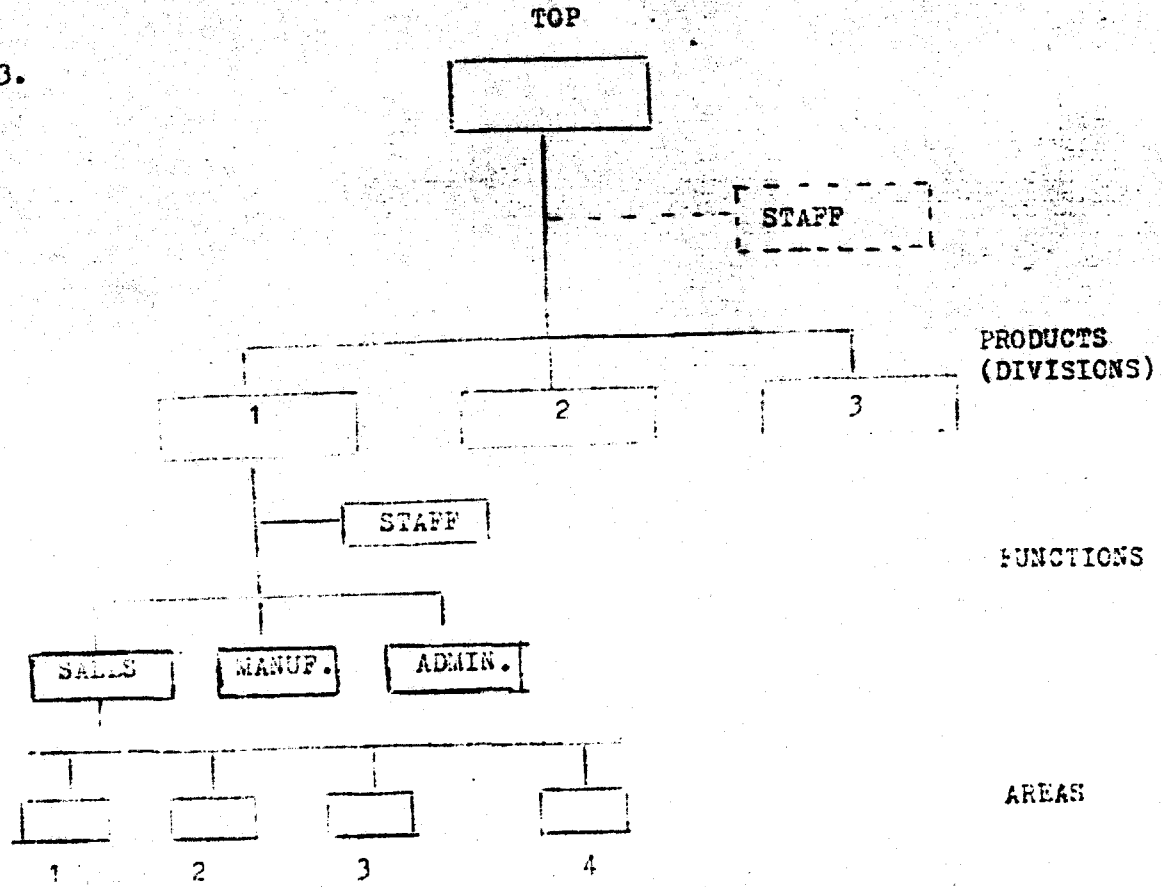

O. HEINONEN

MARKET SHARE

1. Can be measured reliably only if you define the market as a group of end-users/consumers with common characteristics, e.g., Mexican newspaper (morning-evening) publishers.
2. Correlates positively with return of investment.
3. Influences the learning curve and reduces the cost, e.g.
  - production
  - marketing
  - distribution
  - administration overhead
4. Increases the rate of profit and 

{	receivables
	inventory turnover .
5. Increases the cost of R.&D.
6. Is positively influenced by balance between quality, price and non-price competitive measures.

3.

H A N D O U T S

presented by Mr. W. Hübner

#### 4. HUBNER

#### Demand forecasting techniques - general orientation

##### 4. Stages of projecting the future demand for project's output:

- 1) identification of data related to demand in the past;
- 2) defining of a mathematical expression which explains the best movements of demands in the past;
- 3) application of this mathematical expression in order to project the future demand;
- 4) interpretation of results obtained when projecting the future demand by applying a given method;
- 5) comparative analysis of the results produced by application of different methods for demand projections.

##### 5. Methods of demand projection:

1. Average annual rate of growth.

$$I_t = \frac{Y_t}{Y_{t-1}}$$

where:

$I_t$  - index of demand movements,

$Y_t$  - demand in the year "t"

$Y_{t-1}$  - demand in the year prior to "t"

2. Decomposition of time-series:

- trend
- cyclical fluctuations
- seasonal fluctuations
- random (irregular) variations

## 2.1. Linear trend

$$Y = a + b x$$

where a, b - parameters of the trend equation,

x = time

$$b = \frac{\sum x Y - N \bar{x} \bar{y}}{\sum x^2 - N \bar{x}^2} \quad a = \bar{y} - b \bar{x}$$

where:  $\bar{x}$  = the arithmetic mean of the number of years;

$\bar{y}$  = the arithmetic mean of the annual values of demand;

N = the number of years

The "least squares" method.

Criterion: 
$$\sum_{i=1}^n (Y_i - \hat{Y}_i)^2 \rightarrow \min$$

The idea of fitting the algebraic trend curve to the scatter of points depends on the "line of the best fit" for the specific set of data. Such a line should satisfy the criterion of "least squares" - i.e. the sum of squared differences between actual data points ( $Y_i$ ) and corresponding trend points ( $\hat{Y}_i$ ) ought to reach

minimum for "best fit line" as compared with other "potential" trend curves.

The curve of the first degree presents a linear trend, the curves of second and higher degree are related to non-linear trends

## 2.2. Exponential (semi-log) trends:

$$Y = a e^{bx} \quad \text{or} \quad \log Y = a + bx$$

## 2.3. Second and higher degree polynomial trends:

$$\text{eq. } Y = a + bX + cX^2$$

## 2.4. Double-log (Cobb-Douglas) function:

$$Y = a X^b \quad \text{or} \quad \log Y = \log a + b \log X$$

## 3. Regression analysis:

3.1. Identification of variables.

3.2. Carrying out the regression analysis - finding the mathematical expression which describes the relation between dependant and independant variables. Trial and error procedure.

3.3. Projection of the future demand.

3.4. Interpretation of the results

## 4. Consumption level method:

## 5. - Income elasticity of demand

$$E_I = \frac{Q_2 - Q_1}{I_2 - I_1} \times \frac{I_{p1} + I_{p2}}{Q_2 + Q_1}$$

where:

 $Q_1$  - quantity demanded in the base year, $Q_2$  - quantity demanded in the subsequent year, $I_{p1}$  - per capita income in the base year, $I_{p2}$  - per capita income in the subsequent observation year

- Price elasticity of demand

$$E_P = \frac{Q_1 - Q_0}{P_0 - P_1} \times \frac{P_0 + P_1}{Q_1 + Q_0}$$

where:

 $P_1$  - the new price, $P_0$  - the present (base) price, $Q_0$  - the demand at price  $P_0$ , $Q_1$  - demand at the new price.

- Cross elasticity

$$C_{AB} = \frac{Q_{2A} - Q_{1A}}{Q_{2A} + Q_{1A}} \bigg/ \frac{P_{2B} - P_{1B}}{P_{2B} + P_{1B}}$$

$C_{AB}$  - the cross elasticity of product A to product B

$C_{AB} > 0$  - substitution for A

$C_{AB} < 0$  - complementary to A

$C_{AB} = 0$  - no cross elasticity

6. End use or consumption coefficient method.

a) identification of possible uses

b) estimation of input - output coefficient

7. Leading indicator method

Different models of functional relationship

Historical series of per capita consumption of paper and board in the years 1948-59 were correlated with the per capita income (GNP) assuming three different models of functional relationship between the variables:

- A) Assumption that, as income rises, increasing amounts of paper and board will be bought for every new dollar earned (constant percentage change of the consumption at a given rate of change in income)

$$\log y = a + b \log x$$

where y = consumption  
per capita

x<sub>2</sub> = GNP per capita

- B) Assumption that constant amounts will be bought for every new dollar earned.

$$y = a + bx$$

- C) Assumption that marginal propensity to consume will increase but at a slower rate than in A

$$\log y = a - \frac{b}{\log x} \quad (\text{hyperbolic- logarithmic function})$$

1/ From: Pulp and paper prospects in Western Europe, FAO/BLV GmbH, Munich, 1963.

These 3 alternative functional relationships between consumption and income all have shown an excellent fit to the historical data. The results, however, differ very much.

Comparison of 1969 to 1975 increases in paper and board requirements in Western Europe projected from historical (48-59) consumption/income series.

	Regression function			Percent difference	
	A	B	C	A:B	A:C
Total paper and board*/	53.7	38.6	44.4	39	21
Cultural papers	20.7	15.3	17.3	35	20
Newsprint	12.7	8.4	10.4	52	22

\*/ The figures show an increase 1960-75 in kg. per capita

Table 1 - Value of variables during the period 1968-1980

Year	Number of cars	Population in 000	Households in 000	Gross National Product in Millions of Dinars
1	2	3	4	5
1968	253.344	19.644	5.169	177.511
1969	355.875	19.840	5.221	191.520
1970	439.892	20.029	5.271	188.173
1971	562.509	20.209	5.318	206.339
1972	720.874	20.371	5.361	217.947
1973	875.365	20.572	5.414	235.540
1974	1,001,576	20.772	5.466	245.547
1975	1,140,532	20.963	5.517	257.684
1976	1,332,972	21.569	5.569	279.655
1977	1,536,677	21.365	5.622	289.893
1978	1,732,131	21.573	5.677	301.191
1979	1,923,904	21.780	5.732	325.321
1980	1,863,155	21.974	5.783	347.799

EXERCISE:

- 1) Using figures from table 1, estimate parameters of the linear trend

$$Y = a + b x$$

describing the demand for passenger cars in country -A in the given period.

- 2) Applying the linear trend estimate the demand for passenger cars for 1985.

W. Hübner

Demand forecasting - exercise

Solution

$$Y_{85} = 164\ 691 + 148\ 790,3 \cdot X$$

$$Y_{85} = 164\ 691 + 148\ 790,3 \cdot 17$$

$$Y_{85} = 2\ 593\ 526,1$$

Interpretation

1. Demand projections in the national plan?
2. Other projections?
3. Relative saturation of demand - the levels at which demand is being satisfied?
4. Slower demand growth - limiting factors in the product's environment?
  - situation in the balance of payments
  - purchasing power of the population
  - etc etc

Regression analysis

Demand forecasting

Exercise

Information

The data collected have suggested correlation between demand  $X_1$  for commodity  $i=1$  and its price  $P=X_2$ , as it is presented below:

$X$	$X_1$	$X_2$	$X_1^2$	$X_1 X_2$	$X_2^2$
1					
2					
3					
4					
5					
$\Sigma$	10	15	23	35	50

Problem

Estimate the parameters of the demand equation:

$$X_1 = \alpha_0 + \alpha_1 X_2 + \epsilon$$

where:  $\epsilon$  = random error,

$X_1$  = stochastic dependent variable (demand),

$\alpha_i$  = unknown constants

$X_2$  = independent variable (price).

Probability of occurrence of parameters  $\alpha_0$  and  $\alpha_2$  should equal 0.95

Solution:

The set of so-called "normal equations" in this case will be:

$$\bar{X}_1 = a_0 + a_2 \bar{X}_2$$

$$S_{21} = a_2 S_{22}$$

We may compute from the given table:

$$\bar{X}_1 = \frac{\sum x_1}{N} = \frac{10}{5} = 2$$

$$\bar{X}_2 = \frac{\sum x_2}{N} = \frac{15}{5} = 3$$

Elements  $S_{ij}$  may be computed by the general formula:

$$S_{ij} = \sum X_i X_j - N \bar{X}_i \bar{X}_j$$

$$S_{21} = \sum X_1 X_2 - N \bar{X}_1 \bar{X}_2 = 25 - 5 \cdot 2 \cdot 3 = -5$$

$$S_{22} = \sum X_2^2 - N \bar{X}_2^2 = 50 - 5 \cdot 9 = 5$$

Hence; the normal equation will be:

$$2 = a_0 + a_2 \cdot 3$$

$$-5 = a_2 \cdot 5 \quad \rightarrow \quad a_2 = -1 ; a_0 = 5$$

$$X_1 = 5 - X_2$$

Under stochastic conditions:

$$P \left\{ a_0 - t_{\alpha/2; \mu} \cdot D(a_0) < \alpha_0 < a_0 + t_{\alpha/2; \mu} \cdot D(a_0) \right\} = 0.95$$

where  $t_{\alpha/2; \mu}$  may be found in the t-student table

$$t_{\alpha/2; \mu} = 2.5 ; \mu = N - n = 3,$$

where :  $N$  = number of observations,

$n$  = number of estimated parameters)

$t_{\alpha/2; \mu} = 2.5$  : estimates of standard errors of estimators of the parameters:

$$D(a_0) = \frac{Se}{\sqrt{N-n}} = \frac{1}{\sqrt{3}} = \frac{1}{\sqrt{3}} \approx 0.58$$

$$\text{where: } Se^2 = \frac{1}{N-n} \left( S_{11} - a_2 \cdot S_{12} \right) = 1;$$

$$S_{11} = 25 - 5.4 = 8$$

$$P \left\{ 5 - 2.5 \cdot 0.58 < \alpha_0 < 5 + 2.5 \cdot 0.58 \right\} = 0.95$$

$$P \left\{ 3.5 < \alpha_0 < 6.85 \right\} = 0.95$$

$\alpha_0$  is estimated within  $[3.5 ; 6.85]$

with the probability of 0.95

The same method is applied to  $\alpha_2$  :

$$D(a_2) = S_0 \cdot \sqrt{\frac{1}{S_{11}}} = S_0 \cdot \frac{1}{\sqrt{8}} = 1 \cdot \frac{1}{\sqrt{8}} \approx 0.35$$

$$P \left\{ -1 - 2.5 \cdot 0.35 < \alpha_2 < -1 + 2.5 \cdot 0.35 \right\} = 0.95$$

$$P \left\{ -1.87 < \alpha_2 < -0.44 \right\} = 0.95$$

The "null hypothesis" for  $\alpha_2$  :

$$H_0 : \alpha_2 = 0$$

$$\frac{L_2^{-a_2}}{D(a_2)} = \frac{0 + 1}{\sqrt{5}} = \sqrt{5} \approx 2.24$$

$$2.24 < 3.182 \text{ for } t_{0.05; 3}$$

Thus, there is no reason to eliminate the hypothesis that

$\alpha_2 = 0$ ; however, in this case such a conclusion may be due to a very limited number of observations.

Tablica Studenta

N - n	(1 - $\gamma$ ) (dwustronnie)			
	5%	2%	1%	0,1%

$1/2(1 - \gamma)$  (jednostronnie)

Wartość  $t$  dla danego stopnia swobody (N - n) oraz prawdopodobieństwa (1 -  $\gamma$ ).

A.) Long term trends

These are recorded over a long period and such a graph would be called a historigram and would show basic data on graph paper over a " long " period. " Long " needs to be interpreted within the context of the data under review. Trends are established statistically by calculating moving averages over years as in the following table.

<u>Year</u>	<u>Data</u>	<u>3 yrs total</u>	<u>3 yrs moving average</u>	<u>Variation from trend col. 2-4</u>
1969	12			
1970	10	39	13	-3
1971	17	45	15	+2
1972	18	48	16	+2
1973	13	51	17	-4
1974	20	54	18	+2
1975	21	60	20	+1
1976	19	63	21	-2
1977	23			

Special attention must be paid to the plus and minus signs. It must be remembered that it is the actual data which is varying from the trend.

B.) Cyclical movements

These should be isolated in a similar way to the trend except that a further stage is added by taking averages of the trend. Using the data from sub-section A on long term trends where a 3 year moving average was calculated we have:-

<u>Years</u>	<u>Variations from the trend</u>
1969	-
1972	+2 )
1975	+1 ) $\frac{2}{2} = + 1.5$

Variations from the trend

Years 2	1970	-3 )	
	1973	-4 )	÷ 3 = -3.0
	1976	-2 )	
Years 3	1971	+2 )	÷ 2 = 2.0
	1974	+2 )	
	1977		

The final figures give the cyclical variations. Obviously, it is better to make such calculations over as long a period of time as is feasible.

D.) Seasonal variations

These are variations within the year, hence "seasonal". The variations are isolated by taking a series of moving averages within the year. The basic data, therefore, should be weekly, monthly or quarterly. The following tables show the compilation of seasonal variations based on quarterly data.

<u>Year</u>	<u>Quarters</u>	<u>Data</u>	<u>4 qtr totals</u>	<u>Centred totals</u>	<u>Moving average (- 8)</u>	<u>Variation from trend col 3-6</u>
1975	1	5.2				
	2	6.8	28.5			
	3	9.1	27.4	55.9	7.0	+ 2.1
	4	7.4	26.3	53.7	6.7	+ 0.7
1976	1	4.1	25.4	51.7	6.5	- 2.4
	2	5.7	24.5	49.9	6.2	- 0.5
	3	8.2	25.7	50.2	6.3	+ 1.9
	4	6.5	26.9	52.6	6.6	- 0.1
1977	1	5.3	28.1	55.0	6.9	- 1.6
	2	6.9	29.6	57.7	7.2	- 0.3
	3	9.4	29.8	59.4	7.4	+ 2.0
	4	8.0	30.0	59.8	7.5	+ 0.5
1978	1	5.5				
	2	7.1				

Centring is necessary whenever there is an even number in the moving average. The seasonal variation is calculated in the same manner as the cyclical variation.

Year	Quarters			
	<u>1</u>	<u>2</u>	<u>3</u>	<u>4</u>
1975	-	-	+ 2.1	+ 0.7
1976	- 2.4	-0.5	+ 1.9	- 0.1
1977	- 1.6	- 0.3	+ 2.0	+ 0.5
1978	<u>-</u>	<u>-</u>	<u>-</u>	<u>-</u>
Totals	- 4.0	- 0.8	+ 6.0	+ 1.1
Divided by	2	2	3	3
Seasonal Variation =	- 2.0	- 0.4	+ 2.0	+ 0.4

Table 1 - Value of variables during the period 1968-1980

Year	Number of cars	Population in 000	Households in 000	Gross National Product in Millions of Dinars
1	2	3	4	5
1968	253.344	19.644	5.169	177.511
1969	355.875	19.840	5.221	191.520
1970	439.892	20.029	5.271	188.173
1971	562.509	20.209	5.318	206.339
1972	720.274	20.371	5.361	217.947
1973	875.365	20.572	5.414	235.540
1974	1,001,596	20.772	5.466	245.547
1975	1,140,532	20.963	5.517	257.684
1976	1,332.972	21.569	5.569	279.655
1977	1,536.677	21.365	5.622	289.693
1978	1,732.131	21.573	5.677	301.191
1979	1,923.904	21.780	5.732	325.321
1980	1,863.155	21.974	5.783	347.799

EXERCISE:

1) Using figures from table 1, estimate parameters of the linear trend

$$Y = a + b \cdot x$$

describing the demand for passenger cars in country -A in the given period.

2) Applying the linear trend estimate the demand for passenger cars for 1985.

Table

Value of total material inputs		Probability
A. For sales volume: 50,000 (prob. = 0.3)		
$10,000 + 50,000 \times 1.0 = 60,000$		$0.2 \times 0.6 = 0.12$
$10,000 + 50,000 \times 1.3 = 75,000$		$0.2 \times 0.4 = 0.08$
$12,000 + 50,000 \times 1.0 = 62,000$		$0.5 \times 0.6 = 0.30$
$12,000 + 50,000 \times 1.3 = 77,000$		$0.5 \times 0.4 = 0.20$
$15,000 + 50,000 \times 1.0 = 65,000$		$0.3 \times 0.6 = 0.18$
$15,000 + 50,000 \times 1.3 = 80,000$		$0.3 \times 0.4 = 0.12$
Total		1.00
B. For sales volume : 60,000 (prob. = 0.2)		
$10,000 + 60,000 \times 1.0 = 70,000$		$0.2 \times 0.6 = 0.12$
$10,000 + 60,000 \times 1.3 = 83,000$		$0.2 \times 0.4 = 0.08$
$12,000 + 60,000 \times 1.0 = 72,000$		$0.5 \times 0.6 = 0.30$
$12,000 + 60,000 \times 1.3 = 90,000$		$0.5 \times 0.4 = 0.20$
$15,000 + 60,000 \times 1.0 = 75,000$		$0.3 \times 0.6 = 0.18$
$15,000 + 60,000 \times 1.3 = 93,000$		$0.3 \times 0.4 = 0.12$
Total		1.00

Table

Sales volume	Probab.	Price	Prob.	Sales value	Prob.
50,000	0.3	1.6	0.4	80,000	0.32

ECONOMIC EVALUATION

JOSEPH HUBER

PREPARATION, EVALUATION AND FINANCING

IN INVESTMENT PROJECTS

UNIVERSITY OF HAWAII

## ECONOMIC EVALUATION OF INVESTMENT PROJECTS

(Outline of Courses)

### I. Introduction to Economic Evaluation

1. The profitability of an investment can be appraised from the different points of view. One is that of the individual investor for whom the project choice is a comparatively simple and well-defined exercise. There are, however, economic problems which are not perceived by individual investors, as the national economy is not a simple total of individual entrepreneurs. Any investment project has to be evaluated in terms of costs and benefits it generates for the whole society.
2. Commercial profitability analysis, when more deeply scrutinized, reveals numerous shortcomings, foremost among them are:
  - a) Commercial profitability evaluation depends on market parameters (prices, wage rates, foreign exchange rates, interest rates, etc), which are almost always distorted and do not reflect national and social priorities.
  - b) Any investment project may have influences that work outside the market rather than through it (e.g. air or water pollution), which are called "externalities". They do not enter calculations of commercial profitability however they are obviously relevant for social choice.
  - c) Commercial profitability analysis does not take into account various social and political factors (economic self-reliance, military priorities), which are crucial for successful development of the country.
3. Therefore, there is a need for different analytical framework for project evaluation considered from a national point of view. The commercial profitability analysis is not suitable for this purpose.

4. It is an accepted principle that plan requires projects and projects require a plan. This means simply, that a proper economic evaluation of a project cannot be done without central national plan, where basic objectives are formulated and available services identified.

5. The elaboration of a national plan is not an easy task, and among main obstacles are:

- a) High degree of complexity arises from covering all sectors of the national economy,
- b) There is a need to include social factors.

In spite of all difficulties, national plans must be elaborated and formulated, particularly in countries whose economies are in the early stages of development.

6. The national plan assists economic evaluation of projects in the following ways:

- a) It establishes social and national objectives to be pursued by the economy.
- b) The plan assembles data on the available resources.
- c) The plan makes possible the calculation of national parameters.
- d) The plan gives a dynamic picture of the economy as a whole.

7. So far, no perfect planning system has been formulated, and therefore actual central planning in many cases is supported by market mechanism in performing its functions.

## II. Economic Planning - Basic Concepts

8. There are four main elements required for national economic evaluation.

- a) Objectives
- b) Resources
- c) Parameters
- d) Criteria of Selection.

9. Objectives are established within the framework of long-term development strategy in the country. They are next conveyed to central economic plans and formulated into a more specific economic language. While specifying the planning goals, three important problems have to be solved:
  - a) Identification of national objectives
  - b) Ranking of objectives
  - c) Measurement of objectives
  
10. There is no possibility to establish one aggregate objective for a country. In every country the government formulates a set of objectives which are ranked according to priorities. In line with these priorities different criteria should be established in order to measure the project's contribution. One can distinguish basic criteria and additional criteria corresponding to basic and additional objectives respectively, as ranked in the national plan.
  
11. One of the most often used criterion is that of the standard of living or the level of development as indicated by National Income (GNP, JNP). It has some shortcomings, but anyway can serve as the important basic criterion.
  
12. GNP is a macro-level economic term; when translated to the level of project it becomes the value added - the difference between the project's output value and the material inputs value.
  
13. Goals cannot be achieved without resources, which can be classified as follows: human resources, capital resources and national resources.
  
14. All parameters being used in economic planning and evaluation can be divided into three groups: technological coefficients, prices (in the broad sense) and financial parameters.

15. All prices play twofold role in the economy. On one hand they inform about the relative abundance and scarcity of particular goods, services or factors of production. On the other hand they affect the level of real income, having therefore a distribution impact.
16. Objective function is a specific function to be maximized or minimized and it reflects the level (degree) of achievement of predetermined objectives.
17. All elements discussed earlier have different meaning when applied at the project level by individual investors, and when applied at national level by the central economic evaluator. Therefore, national economic and social evaluation of project requires:
  - a) A suitable theoretical concept.
  - b) An institutional framework to carry out national planning and project evaluation.
18. The specific way of introducing particular projects to national plans depends on the planning method in use. There are two comparatively sophisticated practical central planning methods now being used in many countries:
  - a) Balancing method.
  - b) Input-Output method.
19. The general rationale behind the balancing method is that it ensures consistence and coordination between supply and demand. The core of the method consists of four types of balances - material balances, resources balances, foreign trade balances and integrated balances.
20. The more comprehensive method of planning is based on the familiar input - output technique. The core of the method is the preparation of a matrix of flows in terms of physical units and in terms of value units from and to the different sectors of economy.

21. Realistic planning is an iterative process, a kind of dialogue between central economic authorities and particular enterprises, with information, suggestions and guidance flowing in an up-and-down form, and not just "from top down" or "from the bottom up".
22. Central planning system assumes different kinds of plans being formulated within the economy. Plans can be classified according to different criteria, e.g. we distinguish:
  - a) Central plan, sectoral/regional plans and enterprise/local plans.
  - b) Long, medium and short-term plans.
  - c) Direct and indirect plans.

### III. National Economic evaluation

#### Part I - Theory

23. Project selection, however can be discussed as a separate subject, cannot be evaluated in a disjointed manner without close reference to the overall economic strategic plan of the country. Every investment project should be viewed as part of the broad effort to advance the economy and improve the welfare of the people.
24. A project is a complex of economic activities in which we commit scarce resources in expectation of benefits that exceed these resources. It is important to distinguish between projects, that produce goods and services that can be quantifiable and valued, and those that can not.
25. It is well known that the only source for maintaining and increasing both consumption and investment in the long run is the National Income (GNP, NIP) of the country. Since it corresponds to value added at the project level, the measurement of the

project's contribution to the National Income from an assessment of the value added expected to be generated by investment project.

26. The gross value added is defined as the difference between the value of output and the value of current material inputs. If we next deduct from this the investment cost, we arrive at net domestic value added, which again can be sub-divided into two major components - salaries and wages and the so-called social surplus.
27. The estimation of net national value added (defined as a difference between net domestic VA and repatriated payments) for any investment project involves application of three independent procedures:
  - a) Evaluation of direct and indirect effects.
  - b) Screening and ranking tests.
  - c) Evaluation under certainty and un-certainty.
28. Direct effects are easy to quantify - they are related directly to the measurable outputs and inputs. Yet indirect effects are other costs and benefits caused by the project under evaluation, occurring however, in other related projects. A very important type of indirect effect is caused by multiplier mechanisms in the field of consumption, investment and savings.
29. Screening tests aims to differentiate between efficient and non-efficient projects from the point of view of the basic criterion (VA). The valuing tests is run for ranking purposes, if and when more than one project pass screening test.
30. Analysis under certainty assumes certain magnitudes of variables and parameters, which actually are random variables. Un-certainty analysis lifts this assumption, allowing for different values of variables and parameters.

31. All effects caused by project should be valued at their relevant prices. Since these prices differ in most cases from market prices, then a shadow-pricing concept should be used. Shadow price was originally a purely mathematical concept, which, if translated into the language of economic planning, can be understood as marginal increment of the objective function (e.g. GNP), due to a marginal change of the plan's constraints. (e.g. manpower). In practice one can only estimate shadow prices more or less accurately - these estimates are called accounting prices (or adjusted prices).
  
32. Accounting (adjusted) prices may be calculated for main outputs and inputs. Such national accounting prices are then called national parameters. The most essential national parameters are:
  - a) Social Rate of Discount (SRD)
  - b) Adjusted Rate of Foreign Exchange (ARFX)
  
33. SRD is the discount rate at which society as a whole diminishes the weight assigned to next years benefits and costs as compared with those of the current year. Therefore this is a rate of substitution between current consumption and future consumption.
  
34. The calculation of SRD is one of the most difficult task for central planner. In general, SRD depends on many economic and social factors, like: GNP level per capita, supply and demand for capital interest rates prevailing on money markets, inflation rates, development strategy, etc.
  
35. The prevailing market interest rate (on capital markets most relevant for the country) can be the convenient reference level (starting point) for establishing SRD. Then the overall financial position of the country should be taken into consideration

$$\left(\frac{E}{K}\right) \text{GND} = \left(\frac{E}{E-K} + 1\right) \text{GND} = \text{GND}$$

38. This can be explained on the basis of the following account

Whenever there is a change in the value of  $E/K$ , the value of  $\text{GND}$  also changes. Therefore, to obtain a realistic picture of foreign exchange in the world, it is necessary to consider the effect of changes in the value of  $E/K$  on the value of  $\text{GND}$ . There is a common view that the value of  $\text{GND}$  is affected to reflect more precisely the true value of the

where  $\text{GND}_1$  is a special proportional  $\text{GND}$  for a given industry or region

$$\text{GND}_1 = \text{GND} \times \left(\frac{E}{E-K}\right)$$

The general formula for both cases will be:

strategic industries  
 regional regions

36. It is important that a nation-wide uniform  $\text{GND}$  is established as a basis for all projects being evaluated fully comparable, there are, however, situations when a modification of  $\text{GND}$  is necessary:

$$\text{GND} = \text{GND} + \left(\frac{E}{E-K}\right) \times \text{GND}$$

(a) when the country is a net borrower of funds

for present multiplier

where  $\text{GND}_1$  stands for market rate

$$\text{GND} = \text{GND} - \left(\frac{E}{E-K}\right) \times \text{GND}$$

(b) when the country is a net capital lender

where: ORE = official exchange rate

X = value of imports of goods and services or value of current foreign exchange expenditures;

E = value of exports of goods and services or value of current foreign exchange revenues.

10. Social pricing in most cases should be based on the theoretical concept of opportunity cost.

#### IV. General Formula Evaluation

##### Part II - Application

11. If all inputs and outputs are properly estimated, the expected value added of the investment project can be calculated. The general formula is:

$$NDVA = X - (MI + I)$$

where: NDVA = net domestic value added

X = value of output

MI = value of current material inputs

I = value of total investment

The above statistical formula can be transferred to a dynamic one, covering the whole period of the economic life of the project.

$$\sum_{t=0}^n \text{NNVA}_t = \sum_{t=0}^n X_t - \sum_{t=0}^n (\text{MI} + \text{I} + \text{R})_t$$

where: R = repatriated payments

NNVA = net national VA

41. The absolute efficiency test (AET) purpose is to show whether the project's VA covers the expected wage bill and provide some social surplus.

a) For a single operating year:

$$E_t = X_t - (\text{MI}_t + \text{D}) \gg W_t$$

where:  $E_t$  = AET static indicator for year "t";

$W_t$  = total wage bill in the year "t"

b) During project's life time (discounting formula)

$$\sum_{t=0}^n (\text{VA}_t) \cdot \frac{a}{1+a} \gg \sum_{t=0}^n W_t \cdot \frac{a}{1+a}$$

42. Project ranking can be accomplished in several different ways, depending on specific economic condition of the country. First, projects can be ranked according to their absolute VA's generated throughout the life period of the project and discounted. The general rule of the VA maximisation should be followed.

Next, some relative efficiency tests (RET) can be run with the help of the following formulae:

$$E_s = \frac{P(\text{VA})}{P(\text{I})}, \quad E_f = \frac{P(\text{VA})}{P(\text{FE})}, \quad E_L = \frac{P(\text{VA})}{P(L_s)}$$

where: P(VA) = present value added

P(I) = present value of the investment

P(FE) = present value of the net foreign exchange cost

P(Ls) = present value of all wages paid to skilled employees.

43. The basic criterion of VA, although fundamental and comprehensive, does not reflect all possible national objectives and, therefore, has to be accompanied by additional indices, like:

- a) Employment effect
- b) Distribution Effect
- c) Net Foreign Exchange Effect
- d) International Competitiveness

Relevant formula should be used to calculate all these additional indices.

44. Economic evaluation of investment project should always take into account some supplementary considerations about project implications for the national economy e.g. infrastructural implications, technology transfer implications, environmental implication, etc.

45. There are several causes of uncertainty affecting the elements of economic analysis. The most important are:

- a) Price movements and especially inflation increasing prices of inputs and outputs.
- b) Changes in technology, affecting the cost structure and relative prices.
- c) Changes in demand structure, due to new development in the field of taste related industries, etc.
- d) Social and political events.

All these causes have their impact on particular elements of financial analysis, and especially on:

- a) Sales revenue
- b) Investment cost
- c) Production cost
- d) Implementation schedule

46. Uncertainty analysis can be undertaken in three steps: break-even analysis, sensitivity analysis and probability analysis. All these techniques are usually applied during financial evaluation of project. Their use within economic evaluation framework differs only in values of parameters taken into calculations.
47. Uncertainty analysis requires more elaborate computation as compared with the deterministic case, is more costly and time consuming. Therefore, the additional effort required for it has to be justified by the additional benefits of introducing it.
48. When all necessary criteria and indices have been applied, the project evaluator gets a fairly comprehensive picture of the project's contribution to the principal national objectives. The economic evaluation, however, would be incomplete if possible alternatives to the project had not been considered. Even if the evaluation of the project shows its soundness and viability from the national point of view, it is always necessary to compare it with other alternative ventures leading to the fulfilment of the same national objectives.
49. In general, the demand for a good or service can be covered by:
- a) Domestic production
  - b) Imports
  - c) Mixed solution (partly domestically produced and partly imported).

Domestic production requires large investment outlays first to get output later on. Imports means that investment funds can be used otherwise but more negative balance of payments consequences have to be envisaged. Final decision has to be taken after thorough investigation of all possible effects of all conceivable alternatives.

50. The comparison with alternative solutions is made in practice through a "trial-and-error" approach, since sophisticated optimization methods are not available currently to select the optimal solution among all theoretically conceivable projects.

2.1.1.1

2.1.1.1.1

Additional criteria

1) Inclusion of criteria:

$$Z = \frac{\sum_{i=1}^n x_i + \sum_{j=1}^m y_j}{n+m}$$

where:  $\sum_{i=1}^n x_i$  = sum of values

$\sum_{i=1}^n x_i$  = total number of objects of the  
group of objects

$\sum_{j=1}^m y_j$  = total number of objects of the  
group of objects

2) Inclusion of criteria:

1) Inclusion of criteria:

$$Z = \frac{\sum_{i=1}^n x_i}{n}$$

where:  $\sum_{i=1}^n x_i$  = sum of values  
of the objects

$n$  = number of objects

2) Inclusion of criteria:

$$Z = \frac{\sum_{i=1}^n x_i}{n}$$

where:  $\sum_{i=1}^n x_i$  = sum of values of the objects

3) Inclusion of criteria:

1) Inclusion of criteria:

$$Z = \frac{\sum_{i=1}^n x_i}{n} \quad (Z = \frac{\sum_{i=1}^n x_i}{n})$$

where:  $\Delta W_{12}$  = weight change between the two points in the series  
 $W_{12}$  = weight at the second point

$\Delta W_{12} = W_{12} - W_{11}$   
 $W_{12} = W_{11} + \Delta W_{12}$   
 $W_{11} = W_{10} + \Delta W_{11}$

where  $W_{10}$  is the initial weight

$$W_{12} = W_{10} + \Delta W_{11} + \Delta W_{12}$$

where:  $\Delta W_{11}$  = weight change between the first and second point

$\Delta W_{12}$  = weight change between the second and third point  
 $W_{10}$  = initial weight at the first point

where:  $\Delta W_{12}$  = weight change effect (total)

$$\Delta W_{12} = \sum_{i=1}^n \Delta W_{12} + \Delta W_{12} + \Delta W_{12}$$

where:  $\Delta W_{12}$  = weight change between the first and second point

where:  $\Delta W_{12}$  = weight change between the second and third point

where:  $\Delta W_{12}$  = weight change between the first and second point  
 $\Delta W_{11}$  = weight change between the second and third point  
 $W_{10}$  = initial weight at the first point

where:  $\Delta W_{12}$  = weight change between the first and second point  
 $\Delta W_{11}$  = weight change between the second and third point  
 $W_{10}$  = initial weight at the first point

Introduction

The purpose of this study is to

Method

The data were collected through a series of interviews with experts in the field of...

Results

The results of the study indicate that there is a significant correlation between...

Conclusion

In conclusion, the findings of this study suggest that further research is needed...

U. HURSEK

Value added - Probability analysis  
EXERCISE

The central planner evaluates the soundness of an investment project and decides to allow for different values of:

- total investment cost
- value of current material inputs
- selling price
- sales volume
- economic life of the project

Possible alternative values for all the variables and probability values assigned to them are shown in Table 1.

TABLE 1

ITEMS		Possible values	Probability
1. Investment (in $p_s$ )	A	10, 000	0.2
	B	12, 000	0.5
	C	15, 000	0.3
2. Current material inputs per unit (in $p_s$ )	A	1.0	0.6
	B	1.3	0.4
3. Selling price (in $p_s$ )	A	1.6	0.6
	B	1.9	0.4
4. Sales volume (in units)	A	50, 000	0.6
	B	60, 000	0.2
5. Economic life (in years)	A	15	0.5
	B	20	0.3
	C	30	0.2

What is the expected value added generally by the project?

Table

Value of total material inputs		Probability
A. For sales volume: 50,000 (prob. = 0.8)		
$10,000 + 50,000 \times 1.0 = 60,000$		$0.2 \times 0.5 = 0.12$
$10,000 + 50,000 \times 1.3 = 75,000$		$0.2 \times 0.4 = 0.08$
$12,000 + 50,000 \times 1.0 = 62,000$		$0.5 \times 0.5 = 0.30$
$12,000 + 50,000 \times 1.3 = 77,000$		$0.5 \times 0.4 = 0.20$
$15,000 + 50,000 \times 1.0 = 65,000$		$0.3 \times 0.6 = 0.18$
$15,000 + 50,000 \times 1.3 = 80,000$		$0.3 \times 0.4 = 0.12$
Total		1.00
B. For sales volume : 60,000 (prob. = 0.2)		
$10,000 + 60,000 \times 1.0 = 70,000$		$0.2 \times 0.6 = 0.12$
$10,000 + 60,000 \times 1.3 = 88,000$		$0.2 \times 0.4 = 0.08$
$12,000 + 60,000 \times 1.0 = 72,000$		$0.5 \times 0.6 = 0.30$
$12,000 + 60,000 \times 1.3 = 90,000$		$0.5 \times 0.4 = 0.20$
$15,000 + 60,000 \times 1.0 = 75,000$		$0.3 \times 0.6 = 0.18$
$15,000 + 60,000 \times 1.3 = 93,000$		$0.3 \times 0.4 = 0.12$
Total		1.00

Table

Sales volume	Probab.	Price	Prob.	Sales volume	Prob.
50,000	0.8	1.6	0.4	80,000	0.32
50,000	0.2	1.9	0.6	95,000	0.48
60,000	0.2	1.6	0.4	96,000	0.08
60,000	0.2	1.9	0.6	114,000	0.12

Table

Sales volume	Sales revenue	Prob.	Value of material inputs	Prob.	VA	Prob.	Expected VA
1	2	3	4	5	6	7	8
50,000	80,000	0.32	60,000	0.12	20,000	0.038	768
			75,000	0.04	5,000	0.006	128
			62,000	0.30	18,000	0.095	1728

W. HUBNER

SHADOW PRICING  
EXERCISE

Information

1) Production enterprise "La Habana" in the given period "t" has at its disposal 1 000 units of labour (L), and 600 units of production capital (machinery, technical equipment, etc.) (C).

2) Using these resources the enterprise may produce 2 products  $X_1$  (measured in tons) and  $X_2$  (measured in meters)

3) The following vectors describe the interrelation between resources and outputs:

$$L = [\lambda_1 \quad \lambda_2] = [4 \quad , \quad 2] \text{ u.l./t, u.l./m}$$

$$C = [\bar{c}_1 \quad \bar{c}_2] = [3 \quad , \quad 1] \text{ u.c./t u.c./m}$$

4) Prices are given:

$$P_1 = 40p_s/t$$

$$P_2 = 10p_s/m$$

Problem:

1) Find the optimal structure of production of  $X_1$  and  $X_2$  from the point of view of maximization of its value.

2) Compute the shadow prices for both labour and capital. What is their interpretation?

1)  $x_1 \geq 0$

2)  $x_2 \geq 0$

3)  $x_1 + 2x_2 \leq 1000$

4)  $3x_1 + 4x_2 \leq 600$

$$\alpha > \gamma > \text{tg } B$$

constraint 1:

$$4x_1 + 3x_2 \leq 1000$$

constraint 2:

$$3x_1 + 4x_2 \leq 600$$

constraint 3:

$$200x_1 + 150x_2 = V_{\max}$$

For 1.1.1:

$$200x_1 + 150x_2 \geq 0$$

$$200x_1 + 150x_2 \geq 0$$

Definition:  $\min$

$$1) \quad 100P^1(x) + 200P^2(x) = 10 \rightarrow \min$$

Two positive variables  $x_1, x_2$

$$10P^1(x_1) + 20P^2(x_2) = 100 \quad = 10$$

$$10P^1(x_1) + 20P^2(x_2) = 100 \quad = 10$$

$$100P^1(x_1) + 200P^2(x_2) = 10 \rightarrow \min$$

assuming:

$$1) \quad P^1(x_1) = P^2(x_2) = 1$$

$$4) \quad P^1(x_1) = P^2(x_2) = 0$$

$$2) \quad P^1(x_1) = P^2(x_2) = 0$$

$$5) \quad P^1(x_1) = P^2(x_2) = 0$$

$$3) \quad P^1(x_1) = P^2(x_2) = 0$$

$$6) \quad P^1(x_1) = P^2(x_2) = 0$$

We may assume either  $x_1$  or  $x_2$  is zero.  $P^1$  should be a negative  $P^2$ .

$$1) \quad P^1 = -10 \quad P^2 = -10$$

$$4) \quad P^1(x_1) = 10 \quad P^2 = 10$$

$$2) \quad P^1(x_1) = 10 \quad P^2 = -10$$

$$5) \quad P^1(x_1) = 0 \quad P^2 = -10$$

$$3) \quad P^1(x_1) = 1 \quad P^2 = -1$$

$$6) \quad P^1(x_1) = 10 \quad P^2(x_2) = -1$$

We can see these are all the solutions which meet the announced conditions.

Assuming  $x_1$  or  $x_2$  is zero, the solution function will be:

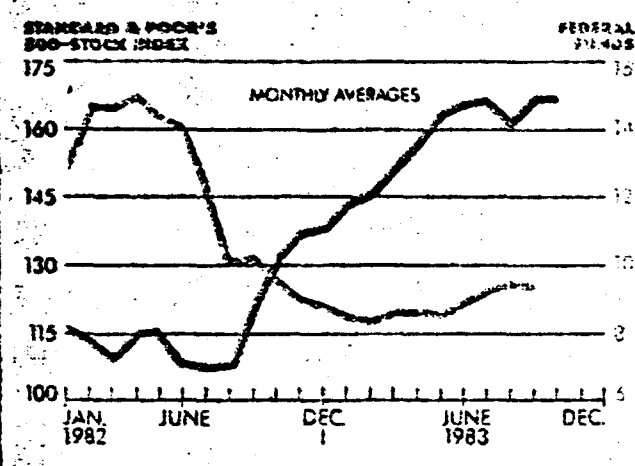

$$1) \quad 100P^1 = 10 \rightarrow P^1 = 10/100 = 0.10 \text{ ps}$$

$$2) \quad 100P^1 + 200P^2 = 10 \rightarrow P^1 = 10/1000 = 0.01 \text{ ps}$$

$$3) \quad (10) \quad (12)$$

We should notice that for the optimal solution.

# Financial Highlights of the Week

Despite some slippage in the federal funds rate, stock and bond prices failed to gain much ground. Several rally attempts in stocks have faltered, in part due to the intensifying tax-loss selling as the yearend approaches. Also damping investor enthusiasm is the continued concern over short-term interest rates, the apparent stalemate over the budget deficit, and the heightened Mideast tension.
