INDUSTRIAL DEVELOPMENT STRATEGIES FOR FISHERY SYSTEMS IN DEVELOPING COUNTRIES: PRESENTATION OF THE MAIN RESULTS

Sectoral Studies Series No. 31

SECTORAL STUDIES BRANCH STUDIES AND RESEARCH DIVISION Main results of the study work on industrial sectors are presented in the Sectoral Studies Series. In addition a series of Sectoral Working Papers is issued.

This document presents major results of work under the element Ficheries Industries in UNIDO's programme of constrict Studies 1986/87.

This document has been reproduced without formal editing.

The designations employed and the presentation of material in this document do not imply the expression of any opinion whatsoever on the part of the secretariat of the United Nations Industrial Development Organization (UNIDO) concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries.

Mention of company names and commercial products does not imply the endorsement of UNIDO.

INDUSTRIAL DEVELOPMENT STRATEGIES FOR FISHERY SYSTEMS IN DEVELOPING CGENTRIES: PRESENTATION OF THE MAIN RESULTS

Sectoral Studies Series No.31

SECTORAL STUDIES BRANCH
STUDIES AND RESEARCH DIVISION

Preface

The Sectoral Studies Branch has undertaken a major study on development strategies for fisheries industrial systems in developing countries. This paper contains a short summary and the principal results of that study, mainly in the form of a set of tables.

In addition to this presentation of the principal results, further study documents include a main report as well as an additional volume describing the methodologies that were used. It is also planned to issue the underlying data base and a set of country case studies separately.

The study has been prepared in close co-operation with FAO.

1. AIM AND PURPOSE OF THE STUDY

The importance of the contribution made by the fisheries sector to national economic, social and nutritional goals is now widely recognized and principles for a strategy and plan of action for fisheries management and development have been laid down. The objectives should be based on an assessment of the fishery resources available and the markets to be served, but other factors, including foreign operations, must also be considered. Most important, the fisheries sector should be viewed as a system in which different industrial, production, consumption and policy components interact. Thus development strategies should be comprehensive and should address multiple objectives.

These principles were recognized at the FAO World Conference on Fisheries Management and Development, held in Rome, July 1984. The present study, prepared by UNIDO in co-operation with FAO, concentrates on an assessment of the fisheries industrial system and its development possibilities in a large number of developing countries. Its main aim is to identify the necessary measures for enhancing the system in the form of government policies, technical assistance from UNIDO and other international organizations and investment requirements.

The major outputs of the study are:

- An assessment of the fisheries systems of 64 developing countries (including a comprehensive data base and 11 detailed country case studies).
- An outline of comprehensive development strategies for those countries, classified into 10 groups, each group having a specific pattern of present and potential development.
- Suggested pattern-specific actions for implementing the strategies and eliminating major problems and bottlenecks.
- A description of the required actions in terms of investment needs, needs for technical assistance, policies, support actions and mechanisms to be applied to the different components of the fisheries industrial system of the 10 groups of countries as well as options for co-operation between the countries.

Another main output of the study is the analysis of the structural components of a fisheries industrial system. This analysis led to a series of specific guidelines that should be considered by those involved in designing development strategies and programmes. These guidelines are presented in detail in chapter 6 of volume 1 of the study but are not further summarized here.

2. DEFINITION OF THE FISHERIES INDUSTRIAL SYSTEM (FIS)

This study concentrates on the industrial system related to the actual or potential exploitation of fish resources in developing countries. In order to make full use of these resources, a large number of industrial inputs are required, both for assisting in the catch and in the handling, processing, distribution and marketing phases. Through well defined support activities to

the industrial sector, UNIDO can make an important contribution to a better exploitation of this important resource for many developing countries. It is necessary, however, to utilize a systematic and comprehensive approach to programming and project development in the sector in order to avoid bottlenecks and suboptimal solutions.

The FIS can be defined as a system where all the industrial production and consumption components related to the fisheries activities in a given country, as well as the policies that affect them, interact in an integrated and interdependent manner.

The suggested approach requires a concrete description of the FIS. In this study the following nine components have been chosen as most appropriate to describe the system: resources (1), extraction/production (2), processing (3), distribution and marketing (4), consumption (5), industrial inputs (6), government policy (7), industrial organization (8), and the foreign sector (9).

A large number of data and information from country case studies and other available material, as well as information obtained from close co-operation with FAO, have been used for the analysis of the FIS components and their linkages in the 64 developing countries. For details of the analysis, please see "Industrial development strategies for fishery systems in developing countries", volume 1.

3. IDENTIFIED DEVELOPMENT PATTERNS

The analysis has yielded the identification of 10 country groups with distinctly different patterns of development with respect to their fisheries industrial system. The identified patterns are the following:

Group 1. The least favoured countries

Generally poor or least developed countries needing fish procein but lacking in skills, inputs or infrastructure to maximize resource use. Countries included: Ghana, Kenya, Madagascar, Malawi, Mali, Nigeria, Sudan, Uganda, United Republic of Cameroon, United Republic of Tanzania, Zaire, Zambia, Bangladesh, Turkey.

Group 2. Largely state controlled fisheries

In these countries' fisheries the government is involved to a large degree. All of these countries have good potential for growth, both in marine and freshwater fisheries. Countries included: Angola, Morocco, Mozambique, Burma, People's Republic of China, Democratic Kampuchea, Viet Nam, Democratic Yemen, Mexico.

Group 3. Low priority fisheries

Fisheries are not a high priority in these countries due to resource limitations, predominance of national wealth in other sectors or other factors. Countries included: Gabon, Sierra Leone, Iran, Iraq, Saudi Arabia, Brazil, Colombia, Venezuela.

Group 4. Labour-intensive fisheries

These countries have large artisanal fishery sectors and big domestic markets. Most of them have well organized fisheries departments and all but two have flourishing inland or freshwater fisheries. Countries included: Algeria, Egypt, Tunisia, India, Indonesia, Pakistan, Sri Lanka.

Group 5. Small states with growth potential

These small population countries all have relatively good fishery potential, particularly for export. Their governments have made fisheries a high priority sector. Countries included: Congo, Oman, United Arab Emirates, Guyana, Fiji, Kiribati.

Group 6. Large but fluctuating resources and limited local demand for fish

These countries have large fish meal industries or export-oriented processing plants. Although their marine resources are substantial, they suffer from considerable natural fluctuations. Countries included: Namibia, Argentina, Chile, Ecuador, Panama (Ex. CZ), Peru, Uruguay.

Group 7. Laissez-faire fisheries

Commercial and private interests predomir te in this group of countries which also have good domestic markets and labour intensive fisheries. They all have a high per capita consumption of fish. Countries included: Côte d'Ivoire, Area of Hong Kong, Republic of Korea, Malaysia, Philippines Thailand.

Group 8. Lack of industrialization

Good fishery potential but with a serious lack of skills and inputs and with a very limited local market. Countries included: Mauritania, Somalia.

Group 9. Likely exporters

Similar to group 5 above, these countries are well poised to develop the export potential of their fisheries. They all have good traditional fishery skills. Countries included: Senegal, Maldives, Solomon Islands.

Group 10. Long distance, state-controlled

Strong government control but with somewhat better developed fisheries, particularly in deep sea operations. Countries included: Democratic People's Republic of Korea, Cuba.

4. SUMMARY OF RESULTS

4.1 Strategies and actions suggested for different country groups

For the fisheries industrial system of each of the country groups described in the previous section, the status, constraints, and factors that could enhance its development were assessed. Strategies and appropriate

actions have been suggested. These results are summarized in tables 1 to 10. For a full analysis please see "Industrial development strategies for fishery systems in developing countries", volume 1.

4.2 Investment and support action required

The results presented below are also summarized in table 11.

Priority actions

Investments. The most frequently required investments are in distribution and marketing components, followed by extraction, fisheries infrastructure and resource management, and then by processing. Investments in the promotion of trade, internal as well as export markets, are required to a lesser extent. The outstanding requirements for investment in the industrial inputs (extraction, processing and fisheries infrastructure) are for the construction of economical and appropriate vessels, investment in cold chain equipment and the implementation of improved fish transport systems. Harbours and ancilliary equipment and fish markets rate high among the fisheries infrastructure investment requirements. The new regime of the seas justifies the high frequency of investment needs for resource management. Among these the most frequent requirements are monitoring, aquaculture and survey followed by policing and conservation. Investment in aquaculture is justified, since aquaculture is one of the important options open to developing countries for increasing the production of fish.

In distribution and marketing, investments in improved fish transport systems are most needed, followed by cold chain and cold store facilities and the construction of harbours and markets. Within the fish transport systems the main activity to be encouraged is the standardization of fish containers and supplies of packing materials. This requires an investment in the manufacture of standard and refrigerated trucks. The high frequency of investment requirements found in distribution and marketing is due to very high losses of fish through spoilage because of lengthy handling and inadequate facilities found at this stage of the FIS in developing countries. The losses of fresh fish due to this reason have been estimated as 1.7 million tons or 10 per cent of all fresh fish caught. Improvements in marketing and distribution facilities and methods are also necessary for promoting fish consumption, especially in those countries where the levels of consumption are below 5 kg per capita per year and/or where the nutritional contribution of fish is very high (up to 40 per cent of the total animal protein consumption). Thus domestic trade-related priority actions are needed in groups 3, 6, 8 and 9. These actions should be accompanied by consumer education and institutional feeding programmes in the case of those countries where low levels of consumption prevail.

In extraction, the construction of vessels is the most frequent requirement which should be viewed together with the development of the local fleet and the availability of iceplants. In this sense the main activity is to integrate projects involving all village activities including fishermen/boat builders. The best investment would be to assist local boat builders and incorporate alternative materials in the construction of vessels. Local production of fishing gear and instrumentation applies only to groups 3, 6 and 7 where the general level of industrial development is relatively high. The activities linked with fishing gear and instrumentation

Table 3. Group 3: Low priority fisheries (Brezil, Colombia, Gabon, Iran, Iraq, Saudi Arabia, Sierra Leone, Venezuela)

| Strategies | Special problems | Reley Cons - traint | Enhan | Appropriate actions | Examples of engoing actions |
|--|--|---------------------------|-------|--|---|
| Improve the institu- tional framework governing fisheries. | Fisheries low priority in national economy. | 21 | 1 | Reassessment of national gnals and priorities. This has already happened to an extent, fluctuating oil prices underlining the importance of domestic food production. | Examination and renewal of fisheries laws and regulations. Redesigning of institutional organization governing fisheries. Co-ordinating fisheries with development plans and policies. (Venezuela) |
| Increase domestic con- sumption of fish among all income groups. | General scarcity of skilled manpower for fisheries due to job opportunities elsewhere. | 24 | | Development of the fishery sector efficiency and productivity to attract more skilled manpower. | Greation of enew fisheries corporation. Promotion of co-operatives among artisenal fishermen. (Venezuela) |
| Expand fishing to all areas of the national EEZ and all major species. | Low demand for fish in domestic markets. | • | | Better marketing and dis- tribution coupled with consumer education programmes. | Improve marketing and distribution of fresh fish. Introduce fish in institutional feeding programmes. (Brazil) |
| Develop aquaculture, both coastel and inland. | Fishing industries generally under- capitalized. | 19 | 14 | Investment by Loth government and private sector, and creation of more attractive climate for fisheriem investment. | Financial assistance to fisheries sector, Promotion of joint ventures in shipbuilding and manufacturing. Technical assistance agreements in fish and shrimp culture. (Venezuela) |
| Increase productivity and improve officiency of both artisenal and commercial sectors of the industry. | Although fisheries ex- ploitation is at a fairly low level, the overall resource is not large by global standards. | 1 | 1 | Wise use of existing resources. Possibly some joint ventures with non-oil producing countries, providing the fuel and capital for fishery exploitation in other country ERZ's. | Tuns fishing venture with non-petroleum country such as with the Saudi/Heldives joint venture companies. (Saudi Arabia) |

Table 4. Group 4: Labour-Intensiva fisheries (Algeria, Egypt, India, Indonesia, Pakistan, Sri Lanka, Tunisia)

| Strategies | Special problems | Relevant Cons- Enha | | Examples of ongoing actions |
|---|---|------------------------|--|--|
| Increase fish production to maintain food secu- rity and employment. | Some major fishing grounds located very far from markets and popula- tion centres. | 13 | Development of good qua- lity processing and curing in rural areas, improve- ment of fish transport and establishment of regular schedules for fish collection boats or trucks | ice plents, cold stores and fish transport vessels, with finance from ADB. (Sri Lanks, Indonesia) |
| Improve marketing and distribution to reise consumption in inland areas. | Capture and processing technology inefficient or energy expensive in some areas. | 3 4 | Increased use of artisanal fishermen and intermediate technology vessels in off-shore fisheries. Energy conservation and more efficient energy use in fish plants. | working around a mothership from a large |
| Decrease waste by re- ducing spoilage and by utilizing by-catch from shrimp traviers. | Pishermen and fish plant operators lack knowledge of modern gear and techniques and of the operation, maintenance and repair of engines and machinery | | Training of personnel at all levels but with strong amphasis on practical and technical aspects. | Establishment of training centres, academies, colleges and university departments for fisheries. Fisheries research projects on waste fish utilization. (Indonesia) |
| Increase exports by better quality processing and by hervesting offshore stocks of tune and shrimp. | Appropriate technology for utilization of by- catch not yet ascertained. | | 6 Further research and pilot projects. | |
| Expand equaculture both for food fish and for expert species. | Pish canning plants lack continuity of supply. | 27 | Better marketing and dis- tribution, more freezing and cold store facilities at distant ports. Purchase of frozen fish from abroad to maintain supplies in off seasons. | |
| Develop support industries and general fisheries infrastructure | Artishnal fishermen lack capital and often operate at the mercy of markets and merchants. | 21 | 6 Establishment of co-opera- tives, small scale credit schemes and support by extension services. | Ministry of co-operatives, fisheries projects K.I.K(small scale credit Indonesia) fisheries programmes. Fisheries extension service and co-operative establishment. (Indonesia) |
| | Pish farmers have difficulty getting legal access to land and water Pish culture is mostly integrated with small scale agriculture or animal husbandry. | _ | 4 Integration of aquaculture with rural development programmes. Simplification of legal and administrative procedures. Support by extension services. | S.P.D.P. ADB project. Hilsteral and World Bank aid for brackish water ponds. |

should aim to introduce and to use fish detection instruments and fisheries charts, and appropriate offshore and deepwater fishing gear. It is important that investment be encouraged for equipping local workshops.

In processing, the greatest need is for investment to improve methods of fish curing. Cured products are usually for the local market and around 25 per cent of dried/cured fish is lost annually through spoilage. The main activity, therefore, should be to reduce losses and improve the quality of cured fish. Consequently, investment should be encouraged in solar fish driers and solar disinfection units as well as in equipment and facilities for sea salt production. Energy efficient plants and processes are seen to be important for groups 1, 4 and 6 and selective rehabilitation for groups 2, 5 and 6. Finally, energy consumption rates are important and an investigation of possibile economies in operation are activities to be encouraged. Such energy economies could be attained through investment in improved insulation, plant upgrading and the installation of more efficient processing units. Investments are also required in the construction of energy efficient buildings and in the use of locally available renewable energy sources. The rehabilitation should not be generalized, but should address the problem of over-capitalization and promote the rationalization of specific industrial processing lines.

Support actions

The support action most widely required is training, which is a generalized need for all groups. The most important need is the training of fishermen, followed by training in quality control.

Credit finance and joint ventures are important mechanisms for the development of the FIS together with specific government policies and research and development. The least number of specific requirements is found in direct transfer of advanced technology. This is probably due to the fact that this activity is implicit in several other mechanisms such as training, research and development, and the use of joint ventures.

The credit requirements are mainly for small scale, the type of credit that is usually scarce in developing countries.

Government policies. The establishment or improvement of institutional and legal infrastructure is an important support action. It is interesting to note that only in group 3 countries have governments generally not already considered fisheries as a priority sector. For all other groups a high to medium government priority has been given and though goals have often been established, integrated development policies usually have not been developed and applied. For this reason, the establishment of such policies appears as an important remedial input for all groups.

Research and development needs for resources are specified only for group 6, where a diversification strategy based on fish resources and markets was found to be most appropriate. However, research on resources is implicit in survey and other management activities. Other research requirements relate to processing, marketing and climatically appropriate energy systems. These are areas where results obtained at a local research institution could easily be transferred to other countries in the group and eventually to other country groups. The possibility of promoting joint co-ordinated research work for countries within a group should also be explored.

Table 11 gives, at a glance, an idea of the multiple actions, for each of the country groups, that have to be taken by the government and by the private sector, promoted by international and bilateral agencies and aid groups and supported by international development banks and other agencies. These actions are priority actions for implementing the suggested group-specific strategies. However, as important as these sets of actions are, great care should be taken not to implement them partially, since they were designed to be applied in an integrated manner.

4.3 Opportunities for co-operation between developing countries

The scope for technical co-operation between developing countries is considerable. Table 12 lists some of the expertise available in developing countries which could be used to promote the development of the fisheries industrial systems within the context of south-south co-operation. Several governments in major fishery regions are already working closely together on resource management and assessment. Technical assistance between countries has taken place mainly through the FAO TCDC programme and through regional associations like ASEAN. Some commercial interchange and co-operation also takes place, particularly in marketing and this has received a substantial boost from the four regional fish market information units, INFOPFSCA, INFOFISH, INFOPECHE and INFOSAMAK.

There is considerable expertise in fish culture in Asia and the Far East, in processing and marketing in Latin America, and in specific capture technologies and management regimes in particular countries in each of the continents. To date there has been little direct interregional co-operation except through United Nations agencies and international development bank projects and efforts should be made to promote south-south co-operation utilizing additional mechanisms to the ones mentioned above.

Countries with good experience in offshore capture fisheries are found in groups 2, 4, 6, 7 and 10. These include Morocco, Mexico, Indonesia, Chile, Peru, Republic of Korea, Thailand, Democratic People's Republic of Korea and Cuba. States with well developed artisanal fisheries in groups 4, 5, 7 and 9 include Indonesia, Oman, Philippines and Senegal. Countries with some years of experience of foreign fleets fishing under licence or in joint ventures are Nigeria, Mozambique, Indonesia, Mauritania and Maldives in groups 1, 2, 4, 8 and 9.

High quality artisanal processing skills are found in the Far East, particularly in the Philippines and Thailand (group 7) but also in some countries of West Africa and Central America. Export processing industries are mainly found in group 7 countries (Chile, Ecuador, Peru, etc.) with some in group 2 (Morocco, Mexico, Mozambique).

Important fishing countries with expertise in aquaculture are the People's Republic of China (group 2), Indonesia (group 4), Ecuador (group 6) and the Philippines (group 7). Brazil, Chile and India also have advanced systems for breeding certain species.

Some more specific examples of technology expertise which might be usefully transferred within regions are listed in table 12.

a/ The above list is only a general indication of countries with experience and skills in the various areas. A comprehensive listing would be much more extensive but would also need to detail technologies and locations more precisely.

5. SUMMARY OF REQUIRED TECHNICAL ASSISTANCE ACTIVITIES AND INVESTMENT

The identified technical assistance and investment requirements are summarized in table 13. This summary is made according to the components of the fisheries industrial system rather than according to countries or country groups (country-specific actions are presented in the main study).

On the basis of these results country-focussed programmes and projects to promote the development of the industrial activities required to stimulate the full use of the fish resources will be developed. This will require co-ordinated actions with FAO and other international organizations. Similarly, through its investment promotion mechanism - and following its regular procedures - UNIDO will be able to help attract necessary investment resources. At the request of interested countries further detailed studies could be made: first, a quantified and specific assessment of the resources required for obtaining a certain goal for the sector and second pre-feasibility and feasibility studies in order to start-up the actual execution of development projects in the fisheries industrial system.

UNIDO has a range of suitable methodologies and vast experience in their application for developing and executing the necessary support programmes for an integrated sector development. A common philosophy behind these methodologies is that they should be ultimately transferred to the developing countries themselves for use in the actual planning, management and monitoring of the development of the industrial sector under consideration.

Technical assistance activities and investment requirements Table 13.

| Components | Activities | Investments |
|---------------------------------------|---|--|
| Resource management | | |
| Surveys and research | Accoustic and biological surveys: of biomass and fish stocks. | Research stations and vessels, staff |
| Monitoring and statistics | Collection and compilation of catch/effort data and length/frequency data. | Fort fishery offices, samples programs systems. |
| Legislation and policing | Control of fleet size or power. Control of pollution environment. Control of fishing pressure or harvested amount. | Fishery protection vessels and/or airc |
| Conservation and enhancement | Control of capture of juvenile fish. Hanagement of coastal zones and inland waters. | Production of larvae for stocking lake Construction of artificial reefs, replacements. |
| Aquacul ture | Promotion of fish farming by information, credit and technical assistance. Provision of culture services, fis. fry, feed and fertilizers. | Establishment of fish hatcheries and : |

SOMMAIRE

Ce document présente les principaux résultats d'une importante étude portant sur le système industriel des pêches dans les pays en développement.

L'étude résumée dans ce document se fonde sur l'analyse de nombreuses données portant sur 64 pays en développement dont onze font l'objet d'une monographie.

L'étude évalue le système industriel des pêches dans 10 groupes de pays ayant chacun leur propre modèle de développement. Pour chacun de ces modèles on met en évidence les options stratégiques, l'investissement et l'assistance techniques requis. Sur les résultats de l'étude il est possible d'élaborer des programmes de développement intégrant l'ensemble du système de l'industrie de la pêche en s'aidant des méthodes habituellement utilisées par l'ONUDI telle que MEPS (Méthode d'Evaluation et de Programmation des Systèmes de Production et de Consommation).

EXTRACTO

Este documento presenta los resultados más importantes derivados de un estudio mayor preparado sobre el desarrollo de estrategias para los sistemas industriales de las industrias pesqueras en países en vías de desarrollo.

El estudio, el cual fué resumido en este documento, está basado en un análisis de una gran cantidad de información sobre 64 países en vías de desarrollo, incluyendo estudios individuales sobre 11 países. Evalúa el sistema pesquero industrial en 10 grupos de países según sus sistemas específicos de desarrollo. Para cada sistema de desarrollo se presentan opciones para formular estrategias y se describen los requerimientos para inversiones y asistencia técnica. Sobre la base de los resultados del estudio se pueden elaborar programas para el desarrollo integral del sistema pesquero industrial utilizando las metodologías standard de la ONUDI, como ser MEPS (Metodología de Evaluación y Programación de Sistemas de Producción y Consumo).

For the guidance of our publications programme in order to assist in our publication activities, we would appreciate your completing the questionnaire below and returning it to UNIDO, Sectoral Studies Branch, Studies and Research Division, D-2073, P.O. Box 300, A-1400 Vienna, Austria
