SPECIFIC CONSUMPTION OF STEEL .

Ouestionnaires on Brazil and Venezuela prepared by Mr. Anibal GOMEZ, consultant to UNIDO, as a contribution of the Sectoral Studies Branch. Division for Industrial Studies, to publication ECE/STEEL/45 of the Economic Commission for Europe.

nesticated

### STUDY ON THE EVOLUTION OF THE

### SPECIFIC CONSUMPTION OF STEEL

### QUESTIONNAIRE

Please return this questionnaire to the Sectoral Studies Branch, IS, of UNIDO by 10 January 1984.

٠.				
1	Country	BRAZIL	Name and function   of official   responsible for reply	ANIBAL GOMEZ GARCIA -   Secretary General - Instituto Latinoame-1   ricano del Fierro y el Acero (ILAFA)
1	Date Sent	March, 16, 1984	Official address	Darlo Urzúa 1994, Santiago 9,
i I I	Signature	Summe	(in £ull) 	P.O. Box 16065, Santiago - Chile

Before starting to answer the questions, please read the entire questionnaire and the explanatory notes.

### Introduction

In view of the difficulty of providing the extremely detailed data for this type of study, the <u>ad hoc</u> meeting on the evolution of the specific consumption of steel on 19 and 20 October 1981 decided the "the questionnairs should cover one sector common to all countries and another sector selected by each country for its particular importance in that country's national economy".

Countries are therefore asked to select another steel-consuming sector and make an analysis similar to that which is requested for the non-electrical machinery industry (Part D of this questionnaire), using all the types of information which are available but which cannot be collected in a systematic way by means of a general questionnaire.

Further, countries are asked for a qualitative assessment and explanations of the trends observed in steel consumption.

#### A. General

- 1. How do you measure the steel consumption of a steel-consuming sector in your country and how is it defined (see footnote 5)? Please provide the relevant data for each individual steel-consuming sector according to the ISIC (International Standard Industrial Classification), Statistical Papers, M. No.4, Rev.2, Add.1, UN, 1971 (see footnote 3 (b)).
- 2. How is the production of a steel-consuming sector measured in your country and how is it defined (see footnote 3 (a) and (b))? Please provide the relevant data for each individual steel-consuming sector, and formulate your answer as for question 1.
- 3. Which combination of the measures and the definitions of the steel consumption (question 1) and of the production of a steel-consuming sector (question 2) is, in your opinion, the most accurate approach to analysing the evolution of the specific consumption of steel?
- 4. Are there any studies available in your country on specific consumption of steel, measured in terms of steel intensities or in any other way? (Compare the measure of specific steel consumption given in question 43).
- lg/ind/82/17 (a) GE.82-24174

## n.a. = not available

- 1/ It would be preferred if investigation were undertaken of long time series from 1960 to 1980 in absolute figures and covering every year. However, if this is not possible, countries are requested to provide data for every fifth year.
- 2/ Kindly define the coverage of "total steel production" and give the definition of crude steel which is in use in your country.

- 1/ It would be preferred if investigation were undertaken of long time series from 1960 to 1980 in absolute figures and covering every year. However, if this is not possible, countries are requested to provide data for every fifth year. Metric tons should be given throughout.
- 3/ (a) The preferred measure of production of a steel-consuming sector is the product value at constant producers' prices (use 1975 as the year of reference); if you can provide data in the total product weight of the end product, please give both. If you cannot provide the data in the form of the above given measures, please give any other available data, such as:
  - the number of units of the end product, their breakdown and their average weights
  - some production indices based on value added;
  - any other measure (please specify it).
  - (b) It is desirable to define the steel-consuming sectors according to the ISIC (International Standard Industrial Classification), Statistical Papers, N. No.4, Rev.2, Add.1, UN, 1971, but since the nomenclature of the sectors is often different in different countries, it will be sufficient to give the existing national data obtained from the steel-consuming organizations. In this case, please indicate the coverage of each sector and its corresponding production by weight or volume, specifying the unit of measurement used.
- 1/ Data on steel consumption of the sectors are requested for any single year to serve as weights for calculating an index of the evolution of the sectors.

  The year chosen should be one of the years given in the other tables. Please supply the tonnages of actual direct or final steel consumed, as explained in featnote 5, even if they are approximate. Kindly specify to which series of steel consumption the supplied data refers.

- 1/ It would be preferred if investigation were undertaken of long time series from 1960 to 1980 in absolute figures and covering every year. However, if this is not possible, countries are requested to provide data for every fifth year. Metric tons should be given throughout.
- 3/ (a) The preferred measure of production of a steel-consuming sector is the product value at constant producers' prices (use 1975 as the year of reference); if you can provide data in the total product weight of the end product, please give both. If you cannot provide the data in the form of the above given measures, please give any other available data, such as:
  - the number of units of the end product, their breakdown and their average weights
  - some production indices based on value added;
  - any other measure (please specify it).
  - (5) It is desirable to define the steel-consuming sectors according to the ISIC (International Standard Industrial Classification), Statistical Papers, M. No.4, Rev.2, Add.1, UN, 1971, but since the nomenclature of the sectors is often different in different countries, it will be sufficient to give the existing national data obtained from the steel-consuming organizations. In this case, please indicate the coverage of each sector and its corresponding production by weight or volume, specifying the unit of measurement used.
- 1/ It is desirable to give any available data about the evolution of conversion coefficients for converting actual weight of steel contained goods of the ISIC-182 group of products into finished steel equivalents.

If you cannot provide these data, please give evolution of steel weight in kg per kg of total weight of any other types of goods, such as automobiles, tractors, etc.

Please use additional space for a qualitative assessment and explanations of the trends observed in your country's steel consumption.

# NOTES TO THE QUESTIONAIRE

# B. Steel production

Item 5. "Total steel production" covers total crude steel manufacture, including high, medium and low carbon steels and alloy steels, be these or not submitted to in-ladle secondary refining or to other kinds of further metallurgical processes.

"Crude steel" refers to steel expressed in ingots produced, to continuously cast products and to "steel for castings". In this latter case, the volume considered is the content of the ladle. The data are provided in thousands of tops and in percentages (%).

Item 6. Under steels submitted to in-ladle secondary refining are those submitted to processes outside the steelmaking furnace, such as vacuum degassing, refining in ladle or in special vessels and some special technologies for ingot production. Secondarily refined steels in Brazil are: tool and die steel, stainless steel, some types of steel for mechanical construction (ball bearing steels, free cutting steels, heat treatment steels, case-hardening and spring steels) and steels with special mechanical properties (silicon steels, steels with low contraction, etc.). The data are provided in percentages (%). There is no information available for the first years of the 1960's, when production was not very significant.

# C. Total steel consumption

Item 7 to 11. The measure used for production of the Brazilian steel consuming sectors is the value addes of production, in million of US dollars of 1980. It was not possible to obtain physical production data by sectors.

The data were partly provided by the Instituto Brasileiro de Geografia Estadísticas - IBGE - (Brazilian Institute of Geography and Statistics), of the Ministry of Industry and Trade and partly by the Getulio Vargas Foundation. The data for 1983 were estimated according to the industrial production indexes of the October 1982-September 1983 period provided by the IBGE.

Item 1? to 16. The information about steel consumption by sectors corresponds to the following sources: for 1969, a special study prepared in 1970 by Tecnometal Estudos e Projetos Industriais S.A. about the Brazilian steel market, requested by the Instituto Brasileiro de Siderurgia - IBS - (Brazilian Iron and Steel Institute) corresponding to a survey that included a direct questionaire to final steel consumers and distributors. The figures reflect direct actual steel consumption by sectors. For 1972, 1975, 1980 and 1982, CONSIDER (Conselho da Siderurgia e Não Ferrosos)'s series of direct actual steel consumption, distributed by sectors, according to statistical information from the IBS's yearbooks. Since the classifications of the above organizations do not correspond exactly to the sectors required in UNIDO's questionaire, it was necessary to group the figures of the different sub-sectors to form each final consuming sector according to a selective criterium. For example, the sector "manufacture of transport equipment" (384) includes the steel consumed by the sub-sectors: car, railway, shipbuilding and planebuilding industries and manufacture of parts and spare parts for automotives and tractors. The sector of non-electrical machinery includes agricultural and road machinery and industrial machinery and equipment. The metallic product manufacturing sector (381) includes wire drawing facilities (wires, nails, etc.), welded tube, manufacturing facilities, tinplate-containers (cylinders and drums) and plate re-rollers.

Item 17. The 1969 data were taken from the Tecnometal study. The 1972 to 1982 data are from CONSIDER. These data on actual consumption of finished steel products were obtained by the algebraic sum of sales for domestic market by steelworks (including imports), direct imports and variations in stored supplies (of consumers or dealers). It was not possible to make a breakdown in alloy steels, non-alloy steels and heat treated steels. The item "Cold rolled flat products" includes coated plates. "Heavy long products" includes medium and heavy shapes and rails. "Light long products" includes reinforcing bars, wire rod and bars for other uses.

The figures given in item 17 correspond to actual consumption of final steel products in Brazil, determined by CONSIDER. They do not include data on semi-finished steel products neither of cast steel or cast iron products. There are not data available on actual steel consumption before 1969 because no in-depth studies had been made of sectorial demand.

Item 18. Final actual steel utilization is equal to the direct actual steel consumption minus the balance of indirect trade of steel manufactured products. These latter include imports and exports of tools, machines and mechanical and electrical devices (motors, assemblies, etc.), transport material and other products that contain steel.

Item 19. The final actual steel consumption was calculated by the algebraic subtraction of the balance of indirect trade of steel in all goods from the figures for direct actual consumption. The import and export items as regards the steel products contained in them were calculated to determine indirect steel trade.

Item 22. Corresponding to the actual consumption data of end steel products of the non-electrical machinery sector, in thousands of tons. The figures for "long products" include bars, wire rod and light, medium and heavy sections but do not include seamless tubes.

Item 26. Corresponding to available data on actual steel consumption of the agricultural machinery and equipment sub-sector, including also the steel consumed in tractors and agricultural implements other than machinery.

Items 23 to 25 and 27 to 43. There are no specific data about steel losses as percentage of steel consumption. There are only global indicators of steel losses in the transformation process from ingots to end products, which are estimated in 25 to 30% for "long products", 35 to 40% for "flat products" and 43% for "tin plates".

The available information does not allow a breakdown of steel consumption for sub-sectors like ISIC 3823, 3824, 3825 and 3829 since it is differently grouped. For instance, mechanical machinery includes the consumption of steel products in machinery for the following industrial sectors: mining, metallurgy, wood, paper, chemical, electric power, cement, textiles, sugar, etc. The same happens with the information available for other sub-sectors.

Neither is it possible to have activity data on the sub-sectors of the non-electrical machinery sector (items 36 to 42) since these were not calculated in the 1960's and it is assumed that the information of the last decade is being investigated by the official economic organizations (Ministry of Industry and Trade).

### General

Answers to the questions.

- 1. Actual steel consumption is equal to the algebraic sum of the companies' sales to the domestic market (including these latter imports), plus direct imports, plus (or minus) the variations in stocks (consumers' and distributors'). The consumption of a steel consuming sector is measured in Brazil by the sum of the consumptions of the different sub-sectors (see note in items 12 to 16).
- 2. The production of a steel consumer sector is measured by the value added of this latter's total production, in terms of constant dollar (constant US dollars).
- 3. I believe that the most accurate approximation to analize the evolution of specific annual steel consumption is the quotient between final actual steel consumption (item 19) and the total production of the steel consumer sectors (expressed in constant values). Both should be measured in indexes.

# Final comment

The little statistical information available about production of the steel user sectors during the 1960's, which is always globalized under the title "production of the manufacturing industry" and the complete absence of actual steel consumption data for those years hinders an analysis of the evolution of the variables described. For the rest, the information appears rather dispersed by sectors, although it has been possible to compile it and tabulate it for some years. If you want a more profound review for the sub-sectors, it should be made with the help of the country's official organizations (mainly CONSIDER, IBS and the Ministry of Industry and Trade).

AND STEEL

# STUDY ON THE EVOLUTION OF THE SPECIFIC CONSUMPTION OF STEEL

#### QUESTIONNAIRE

Please return this questionnaire to the Sectoral Studies Branch, IS, of UNIDO by 10 January 1984.

	<u> </u>		
l Country	Venezuela	   Name and function   of official   responsible for reply	Aníbal Gómez García, Secretary General Instituto Latinoamericano del Fierro y el Acero (ILAFA)
Date sent	March 16, 1984	     Official address	Darío Urzúa 1994, Santiago 9,
Signature	Junean	(in full) 	P.O.Box 16065, Santiago - CHILE

Before starting to answer the questions, please read the entire questionnaire and the explanatory notes.

### Introduction

In view of the difficulty of providing the extremely detailed data for this type of study, the <u>ad hoc</u> meeting on the evolution of the specific consumption of steel on 19 and 20 October 1981 decided that "the questionnairs should cover one sector common to all countries and another sector selected by each country for its particular importance in that country's national economy".

Countries are therefore asked to select another steel-consuming sector and make an analysis similar to that which is requested for the non-electrical machinery industry (Part D of this questionnaire), using all the types of information which are available but which cannot be collected in a systematic way by means of a general questionnaire.

Further, countries are asked for a qualitative assessment and explanations of the trends observed in steel consumption.

### A. General

- 1. How do you measure the steel consumption of a steel-consuming sector in your country and how is it defined (see footnote 6)? Please provide the relevant data for each individual steel-consuming sector according to the ISIC (International Standard Industrial Classification), Statistical Papers, No. 4, Rev. 2, Add. 1, UN, 1971 (see footnote 3 (b)).
- 2. How is the production of a steel-consuming sector measured in your country and how is it defined (see footnote 3 (a) and (b))? Please provide the relevant data for each individual steel-consuming sector, and formulate your answer as for question 1.
- 3. Which combination of the measures and the definitions of the steel consumption (question 1) and of the production of a steel-consuming sector (question 2) is, in your opinion, the most accurate approach to analysing the evolution of the specific consumption of steel?
- 4. Are there any studies available in your country on specific consumption of steel, measured in terms of steel intensities or in any other way? (Compare the measure of specific steel consumption given in question 43).

It would be preferred if investigation were undertaken of long time series from 1960 to 1980 in absolute figures and covering every year. However, if this is not possible, countries are requested to provide data for every fifth year.

Rindly define the coverage of "total steel production" and give the definition of crude steel which is in use in your country.

(\*) Included in 382. (\*\*) Preliminary figures. (\*\*\*) There are other steel -consuming sectors, as Mining, Patroleum industries, etc.

n.a. = not available.

If would be preferred if investigation were undertaken of long time series from 1960 to 1980 in absolute figures and covering every year. However, if this is not possible, countries are requested to provide data for every fifth year. Metric tons should be given throughout.

- 3/ (a) The preferred measure of production of a steel-consuming sector is the product value at constant producers' prices (use 1975 as the year of reference); if you can provide data in the total product weight of the end product, please give both. If you cannot provide the data in the form of the above given measures, please give any other available data, such as:
  - the number of units of the end product, their breakdown and their average weight;
  - some production indices based on value added;
  - any other measure (please specify it).
  - (b) It is desirable to define the steel-consuming sectors according to the ISIC (International Standard Industrial Classification), Statistical Papers, M. No.4, Rev.2, Add.1, UN, 1971, but since the nomenclature of the sectors is often different in different countries, it will be sufficient to give the existing national data obtained from the steel-consuming organizations. In this case, please indicate the coverage of each sector and its corresponding production by weight or volume, specifying the unit of measurement used.
- 4/ Data on steel consumption of the sectors are requested for any single year to serve as weights for calculating an index of the evolution of the sectors. The year chosen should be one of the years given in the other tables. Please supply the tonnages of actual direct or final steel consumed, as explained in footnote 5, even if they are approximate. Kindly specify to which series of steel consumption the supplied data refers.

/ It would be preferred if investigation were undertaken of long time series from 1960 to 1980 in absolute figures and covering every year. However, if this is not possible, countries are requested to provide data for every fifth year. Matric tons should be given throughout.

The data on actual consumption covers the total consumption of finished steel products on the consumer side. It must not be confused with the direct apparent steel consumption which is calculated by adding imports to and subtracting exports from the domestic production of finished steel products. The actual consumption of finished steel is defined as follows:

- Direct actual steel consumption is calculated by subtracting the increase in merchants' and users' stocks of finished products and semis from apparent steel consumption;
- Final actual steel utilization is equal to the direct steel consumption minus the balance of indirect trade of products of first transformation and the other intermediate goods (such as forgings, engines, ball-bearings, etc.). This final use of steel includes consumption of transformed finished steel products, those sub-contracted and components from other industries, as explained in footnote 6. If it is possible to obtain a series relating to the final use of steel, these data are preferable to the series of direct actual consumption only.
- Final actual steel consumption is calculated by algebraic subtraction of the balance of indirect trade of steel in final goods from the figures for final actual utilization or by algebraic subtraction of the balance of indirect trade of steel in all goods from the figures for direct actual consumption.

Please differentiate between steel industry products and products of first transformation in accordance with the ISIC definition (International Standard Industrial Classification, Statistical Papers, M. No.4, Rev.2, Add.1, UN, 1971).

- If would be preferred if investigation were undertaken of long time series from 1960 to 1980 in absolute figures and covering every year. However, if this is not possible, countries are requested to provide data for every fifth year. Metric tons should be given throughout.
- 6/ The preferred measure of steel consumption of a steel-consuming sector is steel delivered to the sector by weight, which is defined as direct purchases of finished steel.

  Direct purchases of finished steel by a steel-using industry must comprise direct deliveries by the domestic steel industry + direct deliveries by the sector of first transformation, if not included in the domestic steel industry + deliveries by steel traders + direct imports by the steel-using industry + deliveries by assembly plants, foreign subsidiaries, or other steel-using industries.

If you cannot provide the data on direct purchases of finished steel defined as above, please give any other available data about the measure of input of steel, such as: steel used in production of the end product of sector; steel contained in the end product; any other measure.

If you use any other unit of measurement than tonnage, please specify it. Kindly define the product coverage of "total steel and iron consumption".

- If would be preferred if investigation were undertaken of long time series from 1960 to 1980 in absolute figures and covering every year. However, if this is not possible, countries are requested to provide data for every fifth year. Metric tons should be given throughout.
- 3/ (a) The preferred measure of production of a steel-consuming sector is the product value at constant producers' prices (use 1975 as the year of reference); if you can provide data in the total product weight of the end product, please give both. If you cannot provide the data in the form of the above given measures; please give any other available data, such as:
  - the number of units of the end product, their breakdown and their average weight;
  - some production indices based on value added;
  - any other measure (please specify it).
  - (b) It is desirable to define the steel-consuming sectors according to the ISIC (International Standard Industrial Classification), Statistical Papers, M. No.4, Rev.2, Add.1, UN, 1971, but since the nomenclature of the sectors is often different in different countries, it will be sufficient to give the existing national data obtained from the steel-consuming organizations. In this case, please indicate the coverage of each sector and its corresponding production by weight or volume, specifying the unit of measurement used.
- 7/ It is desirable to give any available data about the evolution of conversion coefficients for converting actual weight of steel contained goods of the ISIC-382 group of products into finished steel equivalents.

If you cannot provide these data, please give evolution of steel weight in kg per kg of total weight of any other types of goods, such as automobiles, tractors, etc.

Please use additional space for a qualitative assessment and explanations of the trends observed in your country's steel consumption.

### NOTES TO THE QUESTIONAIRE

### VENEZUELA

# B. Steel production

Item 5. "Total steel production" covers total crude steel manufacture, including high, medium and low carbon steels and alloy steels, be these or not submitted to in-ladle secondary refining or to other kinds of further metallurgical processes.

"Crude steel" refers to steel expressed in ingots produced, to continuously cast products and to "steel for castings". In this latter case, the volume considered is the content of the ladle. The data are provided in thousands of tons and in percentages (%).

Item 6. Under steels submitted to in-ladle secondary refining are those submitted to processes outside the steelmaking furnace, such as vacuum degassing, refining in ladle or in special vessels and some special technologies for ingot production.

No secondary refined steel has been produced in Venezuela from 1960 to 1982. If it had been produced in some of those years, it was not a significant amount.

## C. Total steel consumption

Items 7 to 11. The measure used for the production of Venezuelan steel consuming sectors is the total value of production, at current prices, in millions of bolivares. It was not possible to obtain the value added of production or physical production data by sectors.

The data were provided by the Central Bank of Venezuela. The data for 1983 were not available. The data for item 383, "Manufacture of electrical machinery..." from 1960 to 1967 were included in item 382.

Items 12 to 16. The information about steel consumption by sectors corresponds to the following sources: for 1969, a special study prepared in 1971 by C.V.G. Siderūrgica del Orinoco C.A. (SIDOR). For 1975 and 1980, the data were partly estimated from a sectorial breakdown and other data supplied by SIDOR. For 1982, special study prepared in 1983 by SIDOR. There were other steel consuming sector, as the Mining, and Petroleum industries, which were excluded from this part of the questionaire but not from total actual consumption.

Item 17. The 1969 and 1982 data were taken directly from the Market Research Department of SIDOR in Caracas. The 1975 to 1980 data were partly estimated from data supplied by SIDOR. These data on actual consumption of finished steel products were obtained by the algebraic sum of sales for domestic market by steelworks (including imports), direct imports and variations in stored supplies (of consumers or dealers). It was not possible to make a breakdown in alloy steels, non-alloy steels and heat treated steels. The item "Cold roiled flat products" includes coated plates. "Heavy long products" includes medium and heavy shapes and rails. "Light long products" includes reinforcing bars, wire rod and bars for other uses.

The figures given in item 17 correspond to actual consumption of final steel products in Venezuela. They do not include data on semi-finished steel products neither of cast steel or cast iron products. There are no data available on actual steel consumption before 1969 because no in-depth studies had been made of sectorial demand.

- Item 18. Final actual steel utilization is equal to the direct actual steel consumption minus the balance of indirect trade of steel manufactured products. These latter include imports and exports of tools, machines an mechanical and electrical devices (motors, assemblies, etc.), transport material and other products that contain steel.
- Item 19. The final actual steel consumption was calculated by the algebraic subtraction of the balance of indirect trade of steel in all goods from the figures, for direct actual consumption. The import and export items as regards the steel products contained in them were calculated to determine indirect steel trade.
- Item 22. Corresponding to the actual consumption data of end steel products of the non-electrical machinery sector, in thousands of tons. The figures for "long products" include bars, wire rod and light, medium and heavy sections but do not include seamless tubes.
- Items 23 to 43. There are no specific data about steel losses as percentage of steel consumption. There are only global indicators of steel losses in the transformation process from ingots to end products, which are estimated in 25 to 30% for "long products", 35 to 40% for "flat products" and 43% for "tin plates". The available information does not allow a breakdown of steel consumption for sub-sectors like ISIC 3823, 3824, 3825 and 3829 since it is differently grouped. For instance, mechanical machinery includes the consumption of steel products in machinery for the following industrial sectors: mining, metallurgy, wood, paper, chemical, electric

power, cement, textiles, sugar, etc. The same happens with the information available for other sub-sectors.

There are no data available about the activity in the sub-sectors of the non-electrical machinery sector (items 36 to 42) because no studies have been carried out to that respect.

## General

# Answers to the questions

- 1. Actual steel consumption is equal to the algebraic sum of the companies' sales to the domestic market (including these latter imports), plus direct imports, plus (or minus) the variations in stocks (consumers' and distributors'). The consumption of a steel consuming sector is measured in Venezuela by the sum of the consumption of the different sub-sectors.
- 2. The production of a steel consumer sector is measured by the total value of the production, in terms of current bolivares.
- 3. I believe that the most accurate approximation to analize the evolution of specific annual steel consumption is the quotient between final actual steel consumption (item 19) and the total production of the steel consumer sectors (expressed in constant values). Both should be measured in indexes.
